## 内 容 提 要

本书涵盖了连续与离散时间信号与系统的方方面面。全书内容分为三大部分, 分别为信号与系统概述、连续时间信号与系统, 以及离散时间信号与系统。书中还有大量的例题和习题, 供学生巩固所学内容。

本书既可作为高等院校电子电气等相关专业学生的参考教材, 又可供电子电气工程师参考。

# Preface

The book is primarily intended for instruction in an upper-level undergraduate or a first-year graduate course in the field of signal processing in electrical and computer engineering. Practising engineers would find the book useful for reference or for self study. Our main motivation in writing the book is to deal with continuous-time (CT) and discrete-time (DT) signals and systems separately. Many instructors have realized that covering CT and DT systems in parallel with each other often confuses students to the extent where they are not clear if a particular concept applies to a CT system, to a DT system, or to both. In this book, we treat DT and CT signals and systems separately. Following Part I, which provides an introduction to signals and systems, Part II focuses on CT signals and systems. Since many students are familiar with the theory of CT signals and systems from earlier courses, Part II can be taught to such students with relative ease. For students who are new to this area, we have supplemented the material covered in Part II with appendices, which are included at the end of the book. Appendices A–F cover background material on complex numbers, partial fraction expansion, differential equations, difference equations, and a review of the basic signal processing instructions available in MATLAB. Part III, which covers DT signals and systems, can either be covered independently or in conjunction with Part II.

The book focuses on linear time-invariant (LTI) systems and is organized as follows. Chapters 1 and 2 introduce signals and systems, including their mathematical and graphical interpretations. In Chapter 1, we cover the classification between CT and DT signals and we provide several practical examples in which CT and DT signals are observed. Chapter 2 defines systems as transformations that process the input signals and produce outputs in response to the applied inputs. Practical examples of CT and DT systems are included in Chapter 2. The remaining fifteen chapters of the book are divided into two parts. Part II constitutes Chapters 3–8 of the book and focuses primarily on the theories and applications of CT signals and systems. Part III comprises Chapters 9–17 and deals with the theories and applications of DT signals and systems. The organization of Parts II and III is described below.

Chapter 3 introduces the time-domain analysis of the linear time-invariant continuous-time (LTIC) systems, including the convolution integral used to evaluate the output in response to a given input signal. Chapter 4 defines the continuous-time Fourier series (CTFS) as a frequency domain representation for the CT periodic signals, and Chapter 5 generalizes the CTFS to aperiodic signals and develops an alternative representation, referred to as the continuous-time Fourier transform (CTFT). Not only do the CTFT and CTFS representations provide an alternative to the convolution integral for the evaluation of the output response, but also these frequency representations allow additional insights into the behavior of the LTIC systems that are exploited later in the book to design such systems. While the CTFT is useful for steady state analysis of the LTIC systems, the Laplace transform, introduced in Chapter 6, is used in control applications where transient and stability analyses are required. An important subset of LTIC systems are frequency-selective filters, whose characteristics are specified in the frequency domain. Chapter 7 presents design techniques for several CT frequency-selective filters including the Butterworth, Chebyshev, and elliptic filters. Finally, Chapter 8 concludes our treatment of LTIC signals and systems by reviewing important applications of CT signal processing.

The coverage of CT signals and systems concludes with Chapter 8 and a course emphasizing the CT domain can be completed at this stage. In Part III, Chapter 9 starts our consideration of DT signals and systems by providing several practical examples in which such signals are observed directly. Most DT sequences are, however, obtained by sampling CT signals. Chapter 9 shows how a band-limited CT signal can be accurately represented by a DT sequence such that no information is lost in the conversion from the CT to the DT domain. Chapter 10 provides the time-domain analysis of linear time-invariant discrete-time (LTID) systems, including the convolution sum used to calculate the output of a DT system. Chapter 11 introduces the frequency domain representations for DT sequences, namely the discrete-time Fourier series (DTFS) and the discrete-time Fourier transform (DTFT). The discrete Fourier transform (DFT) samples the DTFT representation in the frequency domain and is convenient for digital signal processing of finite-length sequences. Chapter 12 introduces the DFT, while Chapter 13 is devoted to a discussion of the  $z$ -transform. As for CT systems, DT systems are generally specified in the frequency domain. A particular class of DT systems, referred to as frequency-selective digital filters, is introduced in Chapter 14. Based on the length of the impulse response, digital filters can be further classified into finite impulse response (FIR) and infinite impulse response (IIR) filters. Chapter 15 covers the design techniques for the FIR filters, and Chapter 16 presents the design techniques for the IIR filters. Chapter 17 concludes the book by motivating the students with several applications of digital signal processing in audio and music, spectral analysis, and image and video processing.

Although the book has been designed to be as self-contained as possible, some basic prerequisites have been assumed. For example, an introductory

background in mathematics which includes trigonometry, differential calculus, integral calculus, and complex number theory, would be helpful. A course in electrical circuits, although not essential, would be highly useful as several examples of electrical circuits have been used as systems to motivate the students. For students who lack some of the required background information, a review of the core background materials such as complex numbers, partial fraction expansion, differential equations, and difference equations is provided in the appendices.

The normal use of this book should be as follows. For a first course in signal processing, at say sophomore or junior level, a reasonable goal is to teach Part II, covering continuous-time (CT) signals and systems. Part III provides the material for a more advanced course in discrete-time (DT) signal processing. We have also spent a great deal of time experimenting with different presentations for a single-semester signals and systems course. Typically, such a course should include Chapters 1, 2, 3, 10, 4, 5, 11, 6, and 13 in that order. Below, we provide course outlines for a few traditional signal processing courses. These course outlines should be useful to an instructor teaching this type of material or using the book for the first time.

- (1) Continuous-time signals and systems: Chapters 1–8.
- (2) Discrete-time signals and systems: Chapters 1, 2, 9–17.
- (3) Traditional signals and systems: Chapters 1, 2, (3, 10), (4, 5, 11), 6, 13.
- (4) Digital signal processing: Chapters 10–17.
- (5) Transform theory: Chapters (4, 5, 11), 6, 13.

Another useful feature of the book is that the chapters are self-contained so that they may be taught independent of each other. There is a significant difference between reading a book and being able to apply the material to solve actual problems of interest. An effective use of the book must include a fair coverage of the solved examples and problem solving by motivating the students to solve the problems included at the end of each chapter. As such, a major focus of the book is to illustrate the basic signal processing concepts with examples. We have included 287 worked examples, 409 supplementary problems at the ends of the chapters, and more than 300 figures to explain the important concepts. Wherever relevant, we have extensively used MATLAB to validate our analytical results and also to illustrate the design procedures for a variety of problems. In most cases, the MATLAB code is provided in the accompanying CD, so the students can readily run the code to satisfy their curiosity. To further enhance their understanding of the main signal processing concepts, students are encouraged to program extensively in MATLAB. Consequently, several MATLAB exercises have been included in the Problems sections.

Any suggestions or concerns regarding the book may be communicated to the authors; email addresses are listed at <http://www.cambridge.org/9780521854559>. Future updates on the book will also be available at the same website.

A number of people have contributed in different ways, and it is a pleasure to acknowledge them. Anna Littlewood, Irene Pizzie, and Emily Yossarian of Cambridge University Press contributed significantly during the production stage of the book. Professor Tyseer Aboulnasr reviewed the complete book and provided valuable feedback to enhance its quality. In addition, Mrinal Mandal would like to thank Gencheng Guo, Meghna Singh, Wen Chen, Saeed S. Tehrani, Sanjukta Mukhopadhyaya, and Professor Thomas Sikora for their help in the overall preparation of the book. On behalf of Amir Asif, special thanks are due to Professor José Moura, who introduced the fascinating field of signal processing to him for the first time and has served as his mentor for several years. Lastly, Mrinal Mandal thanks his parents, Iswar Chandra Mandal (late) and Mrs Kiran Bala Mandal, and his wife Rupa, and Amir Asif thanks his parents, Asif Mahmood (late) and Khalida Asif, his wife Sadia, and children Maaz and Sannah for their continuous support and love over the years.

<b>Part I Introduction to signals and systems</b>	<b>1</b>
<b>1 Introduction to signals</b>	<b>3</b>
1.1 Classification of signals	5
1.2 Elementary signals	25
1.3 Signal operations	35
1.4 Signal implementation with MATLAB	47
1.5 Summary	51
Problems	53
<b>2 Introduction to systems</b>	<b>62</b>
2.1 Examples of systems	63
2.2 Classification of systems	72
2.3 Interconnection of systems	90
2.4 Summary	93
Problems	94
<b>Part II Continuous-time signals and systems</b>	<b>101</b>
<b>3 Time-domain analysis of LTIC systems</b>	<b>103</b>
3.1 Representation of LTIC systems	103
3.2 Representation of signals using Dirac delta functions	112
3.3 Impulse response of a system	113
3.4 Convolution integral	116
3.5 Graphical method for evaluating the convolution integral	118
3.6 Properties of the convolution integral	125
3.7 Impulse response of LTIC systems	127
3.8 Experiments with MATLAB	131
3.9 Summary	135
Problems	137

<b>4 Signal representation using Fourier series</b>	141
4.1 Orthogonal vector space	142
4.2 Orthogonal signal space	143
4.3 Fourier basis functions	149
4.4 Trigonometric CTFS	153
4.5 Exponential Fourier series	163
4.6 Properties of exponential CTFS	169
4.7 Existence of Fourier series	177
4.8 Application of Fourier series	179
4.9 Summary	182
Problems	184
<b>5 Continuous-time Fourier transform</b>	193
5.1 CTFT for aperiodic signals	193
5.2 Examples of CTFT	196
5.3 Inverse Fourier transform	209
5.4 Fourier transform of real, even, and odd functions	211
5.5 Properties of the CTFT	216
5.6 Existence of the CTFT	231
5.7 CTFT of periodic functions	233
5.8 CTFS coefficients as samples of CTFT	235
5.9 LTIC systems analysis using CTFT	237
5.10 MATLAB exercises	246
5.11 Summary	251
Problems	253
<b>6 Laplace transform</b>	261
6.1 Analytical development	262
6.2 Unilateral Laplace transform	266
6.3 Inverse Laplace transform	273
6.4 Properties of the Laplace transform	276
6.5 Solution of differential equations	288
6.6 Characteristic equation, zeros, and poles	293
6.7 Properties of the ROC	295
6.8 Stable and causal LTIC systems	298
6.9 LTIC systems analysis using Laplace transform	305
6.10 Block diagram representations	307
6.11 Summary	311
Problems	313
<b>7 Continuous-time filters</b>	320
7.1 Filter classification	321
7.2 Non-ideal filter characteristics	324
7.3 Design of CT lowpass filters	327

7.4	Frequency transformations	352
7.5	Summary	364
	Problems	365
<b>8</b>	<b>Case studies for CT systems</b>	368
8.1	Amplitude modulation of baseband signals	369
8.2	Mechanical spring damper system	374
8.3	Armature-controlled dc motor	377
8.4	Immune system in humans	383
8.5	Summary	388
	Problems	388
<b>Part III</b>	<b>Discrete-time signals and systems</b>	391
<b>9</b>	<b>Sampling and quantization</b>	393
9.1	Ideal impulse-train sampling	395
9.2	Practical approaches to sampling	405
9.3	Quantization	410
9.4	Compact disks	413
9.5	Summary	415

## **PART I**

# **Introduction to signals and systems**

# Introduction to signals

---

*Signals* are detectable quantities used to convey information about time-varying physical phenomena. Common examples of signals are human speech, temperature, pressure, and stock prices. Electrical signals, normally expressed in the form of voltage or current waveforms, are some of the easiest signals to generate and process.

Mathematically, signals are modeled as functions of one or more independent variables. Examples of independent variables used to represent signals are time, frequency, or spatial coordinates. Before introducing the mathematical notation used to represent signals, let us consider a few physical systems associated with the generation of signals. Figure 1.1 illustrates some common signals and systems encountered in different fields of engineering, with the physical systems represented in the left-hand column and the associated signals included in the right-hand column. Figure 1.1(a) is a simple electrical circuit consisting of three passive components: a capacitor  $C$ , an inductor  $L$ , and a resistor  $R$ . A voltage  $v(t)$  is applied at the input of the RLC circuit, which produces an output voltage  $y(t)$  across the capacitor. A possible waveform for  $y(t)$  is the sinusoidal signal shown in Fig. 1.1(b). The notations  $v(t)$  and  $y(t)$  includes both the dependent variable,  $v$  and  $y$ , respectively, in the two expressions, and the independent variable  $t$ . The notation  $v(t)$  implies that the voltage  $v$  is a function of time  $t$ . Figure 1.1(c) shows an audio recording system where the input signal is an audio or a speech waveform. The function of the audio recording system is to convert the audio signal into an electrical waveform, which is recorded on a magnetic tape or a compact disc. A possible resulting waveform for the recorded electrical signal is shown in Fig 1.1(d). Figure 1.1(e) shows a charge coupled device (CCD) based digital camera where the input signal is the light emitted from a scene. The incident light charges a CCD panel located inside the camera, thereby storing the external scene in terms of the spatial variations of the charges on the CCD panel. Figure 1.1(g) illustrates a thermometer that measures the ambient temperature of its environment. Electronic thermometers typically use a *thermal resistor*, known as a *thermistor*, whose resistance varies with temperature. The fluctuations in the resistance are used to measure the temperature.
