助,特此致谢!

Acknowledgements

First and foremost, I should particularly like to dedicate my gratitude to my supervisor Professor Hu Zhuanglin. It was his lectures on functional linguistics delivered in Beijing Foreign Studies University about eight years ago that brought me into the field of functional linguistics, and it was his timely help and persistent encouragement that have made my study as well as this dissertation possible. It was his detailed and inspiring criticism on my first version of homework on the History of Linguistics that taught me what it meant by doing research work. And it was his meticulous reading of the several drafts of each chapter and his sending me the comments and the piles of reference from abroad that encouraged me to overcome the difficulties lying ahead and to go forward. It is not an exaggeration that without his patient supervision and inspiring criticism, this dissertation could have never been produced.

My special thanks go to Professor Hu Mingyang, a Chinese linguist in Ren Min University. His thought-provoking lecture on the Chinese word class system in FLRP Salon and his personal instruction on the pronoun system in Chinese language enlightened me insightfully.

Special thanks also go to Professor Pan Yongliang, a corpus linguist in PLA Foreign Languages University. Through our telephone talks he has kindly instructed me and encouraged me to

make use of the corpus-based studies to assist my research.

I am very grateful to Professor Matti Rissanen, in Helsinki University. His kindness in sending me his articles as well as his advices is highly appropriated. Though it is a pity that I have not used his corpus in this study, his research method has proven rather helpful.

I am also indebted to Professor Meng Qingmao, a psychologist in Beijing Normal University, and his excellent students, who have kindly helped me with the quantitative analysis in Chapter Eight.

My thanks go to Professor Wang Qiang, Professor Zhou Liuxi, and Professor Chen Daxing in Beijing Normal University, who, in one way or another, helped me directly and indirectly in the past three years of my study there.

Sincere thanks are due to Professor Gao Yihong, Professor Qian Jun and Professor Fan Wenfang whose books have proven to be a timely model for the writing of this dissertation. Professor Gao's Linguistic Salon turns out to be a best classroom where I learned the current developments in linguistics. Professor Qian's *Towards a Relational-Perspective Approach to Syntactic Semantics*, owing to its insightful theoretical analysis and the precise description of the syntactic structures (into which the function words in my study fit), turns out to be a guide in my discussions on the ideational functions of function words.

I am indebted to Professor Tian Guisen for his advices on the proposal in the early stages of this dissertation, to Dr. Peng Xuanwei, a prior learner and also a friend, who kindly shared his ideas and his books whenever he was asked, to Professor Cheng Xiaotang for his considerate advices on various affairs.

My thanks also go to the editors of the foreign language journals in different parts of China, owing to whose efforts the

Chinese versions of several parts of this dissertation have got published. A fragment of Chapter Two, entitled "Function Word Studies in the 20th Century," was published in *Foreign Languages and Their Teaching* Vol. 145, No. 5, 20—22. A major part of Chapter Seven appeared in the article "How Interjections Realize the Tenor of Discourse" in *Foreign Language Education* Vol. 22, No. 3, 14—18. Fragments from Chapter Three and Chapter Five appeared in the article "Research on Models of Tenor of Discourse" in *Journal of PLA University of Foreign Languages* Vol. 24, No. 1, 1—5. A fragment of Chapter Three, entitled "Strata of Reference," appeared in *Journal of Foreign Languages* Vol. 139, No. 3.

Finally a deep sense of gratitude goes to my husband, who, with his love, encouragement, persistent endurance and his hard working, supported me in completing the Ph. D. studies, and to my son, a brave boy, who behaved nicely at school as well as at home while his mother was away at college.

Chapter One Introduction

1.1 Function Word

In the lexis of each language, there are usually recognized two major types of words: lexical words and function words. Lexical words are also called "content words," "notional words" (Gordon & Krylova, 1980), or "full words" (*Ma's Grammar*, 1985), covering the traditional parts of speech like noun, verb, adjective, and adverb. What have been included in the present function word system are words which are usually regarded as "empty words" (*Ma's Grammar*, 1985), "form words" (Sweet, 1955), "structural words" (Gordon & Krylova, 1980), containing the traditional parts of speech like pronoun, conjunction, preposition, article, and interjection.

A definition of function words often draws special attention to their syntactic potentialities to indicate grammatical relationships. **Function words are the words in a language whose major function is to show the grammatical and structural relations between linguistic elements.**

Most grammarians agree that function words fall into a closed system, with limited number. Within each structure, each function word expresses a specific bit of grammatical information, which in isolation may seem small and insignificant, but is really quite important. Sometimes people believe that function words are relatively meaningless when compared to all the meaning expressed by lexical morphemes. But imagine how hard it would be to communicate without function words: Shakespeare's famous poem "Shall I compare thee to a summer's day" would read only

“Compare summer’s day” and Oscar Wilde’s aphorism “The cynic knows the price of everything, but the value of nothing” would read only “Cynic knows price, value” if we ignored the function words.

The salience of their functions in showing grammatical meanings often results in the phenomenon of quite a few grammarians calling them grammatical words or “grammatical morphemes” (Fries, 1940, 1952; Kies, 2001). And according to these grammarians, function words mainly deliver grammatical information. For example the meaning of the preposition *by* in the sentence *The pumping station was built by George himself* expresses only the grammatical information that George was the “agent” responsible for the building of the house. However, function words, like lexical ones, can have more than one meaning. The preposition *by* in the sentence *The pumping station is by the river* has a different meaning (to indicate the location of the house). In fact, most of the functions words are multifunctional—being used in more than one structure to express more than one specific meaning. And this contributes to the fact that most of the function words are used much more frequently than most of the lexical words.

1.2 Background to the Study

Function word studies can be traced far back to the Platonic Meroi Logou tradition. In his dialogues, Plato made a fundamental contribution by dividing the Greek sentence into a nominal and a verbal component, *Onoma* and *Rhema*, which remained the primary grammatical distinction underlying syntactic analysis and word classification in all the later linguistic descriptions (Robins, 1967). With the efforts of philosophers and grammarians such as Aristotle, the Stoics, Thrax, Varro, Prescian, Wilkins, Sweet, Jespersen, Nesfield, Harris, etc., the ancient parts-of-speech system has been developed into a fixed system containing eight to nine word classes, namely noun, verb, adverb, adjective, pronoun, conjunction, preposition, interjection and article (with numerals and determiners
