## 前 言

随着邮电通信事业飞速发展,新技术、新理论、新装备日新月异。我司原组织编写的中专教材有些内容显得陈旧,难于适应新形势下教学的需要,为此我们对教学大纲进行了修订,并对原教材出版计划做了调整,重点突出了新技术方面的教材。今后将陆续出版。

教材是提高教学质量的关键。编写教材时力求以马列主义、毛泽东思想为指导,运用辩证唯物主义的观点阐明科学技术的规律,内容力求结合实际,提高学生的实践动手能力。

对于书中的缺点和错误之处,希望教师和同学们在使用过程中及时指出,以便修改提高。

### Integrated Circuit

When semiconductors were first invented they were packaged individually as discrete transistors, diodes, etc. In 1958, however, the integrated circuit (IC) was invented. This is a complete electronic circuit containing transistors and perhaps diodes, resistors, and capacitors produced entirely on a single chip of silicon, and is often less than a tenth of an inch square<sup>①</sup>.

The advantages of integrated circuits over discrete components lie in their small size, low cost and high reliability. Without such miniaturization the personal computer would not have been possible, for not only does it reduce the physical dimensions to manageable proportions and save money on cabinets, wire and space, but small circuits consume less power and speed up calculations as the electrical signals don't have so far to travel<sup>②</sup>. This also simplifies the control of the various parts of the computer.

At first it was only possible to manufacture a few active elements in one integrated circuit, perhaps a maximum of

ten<sup>⑧</sup>. This was known as small scale integration circuit (SSI). Later, up to one hundred active elements on one chip were achieved and this was known as medium scale integration circuit (MSI). Now we can manufacture far more than this number in one integrated circuit and anything over one hundred is known as large scale integration circuit (LSI). Thirty—thousand active elements have been manufactured on a quarter—inch—square chip and it is expected to be able to achieve one million by 1985. The term Very Large Scale Integration circuit (VLSI) is sometimes used for chips with thousands of active elements. You will be able to put this in its true perspective<sup>⑨</sup> if you realize that in the 1950s a typical electronic computer contained about 4000 valves and these had to be replaced at a rate of about forty a week. It used to be reckoned that the cost of a computer was proportional to the square of its power but with microcomputers this rule has been shattered. Personal computers today, costing less than one thousand pounds, are more powerful than computers costing many hundreds of thousands of pounds only a few years ago<sup>⑩</sup>.

A large scale integrated circuit is a complete electronic circuit manufactured in one package. There are two basic types of integrated circuits. Those which amplify and are used in audio equipment and other linear circuits and those which switch and are used in microprocessors and other digital circuits.

## Notes to the text

1. This is a complete electronic circuit containing transistors and perhaps diodes, resistors, and capacitors produced entirely on a single chip of silicon, and is often less than a tenth of an inch square.

这是一种完整的电子电路,其中含有晶体管,或者就是二极管,以及电阻、电容等,并全部制造在一块不足0.1平方英寸的硅片上。

- 1) 句中 containing 是现在分词作定语,修饰 circuit, pro-

duced 是过去分词作定语,修饰 transistors, resistors and capacitors.

2) and 后面的 is 与前面的 is 是并列的。

3) a tenth of an inch square 意为“十分之一平方英寸”。

2. Without such miniaturization the personal computer would not have been possible for not only does it reduce the physical dimensions to manageable proportions and save money on cabinets, wire and space, but small circuit consume less power and speed up calculation as the electrical signals don't have so far to travel.

没有这种小型化就不可能有个人计算机,因为这种小型化不仅缩小了机器的尺寸,使之灵活易操作,而且节省了机柜、线料和空间等方面的费用,降低了成本,同时,由于电路小、耗能低,并用电信号传递距离短而加快了运算速度。

1) for 引起的并列句表示原因。

2) not only... but also 是并列连词,意为“不仅...而且...”。

not only 位于句前,句子倒装。

3) as 引起原因状语从句。

3. At first it was only possible to manufacture a few active element in one integrated circuit perhaps a maximum of ten.

最初,在一块集成电路芯片里只能包含几个有源元件,至多不超过 10 个。

a maximum of ten = no more than ten

4. You will be able to put this in its true perspective.

你将会正确看待集成电路的价值。

5. Personal computers today, costing less than one thousand

pounds, are more powerful than computers costing many hundreds of thousand only a few years ago.

当今的个人计算机成本不超过 1000 英镑,但其功能远比几年前造价为数十万英镑的计算机的功能强。

句中两个 costing 引起的短语都作定语。

#### 科技英语阅读概念

阅读是获取信息的重要途径,对于科技人员来尤为重要。因此阅读能力的大小决定了获取知识的能力。由于阅读的内容和目的不同,所需采取的阅读方法也不同。常用的阅读方法有通读、细读两种。

通读是为了弄懂大意,了解梗概。这需要读者具备较扎实的英语基础知识和初步的阅读能力,对科技工作者来说,还必须具备一定的专业知识和专业词汇量。

细读是为了深刻理解并且掌握牢记其具体内容。这两种方法在阅读中常常交替使用。往往是先通读一遍,找到自己所需要的内容后,再进行深入仔细的阅读。
