Principles of Data Processing

Concepts, Applications,
and Cases

The Irwin Series in Information and Decision Sciences

Consulting Editors Robert B. Fetter Claude McMillan
 Yale University *University of Colorado*

To Lila and Leslie

The overall purpose of this book is to provide students with an up-to-date and comprehensive introduction to the principles of computers and data processing. This book and accompanying student learning aids and language supplements are intended for the first course in computers and data processing. Previous course work and computer-related experience are not required.

Every effort has been made to make this data processing “package” one of the most effective on the market today. In order to accomplish this objective, a number of features have been built into the book, the study guide, and the language supplements.

FEATURES OF THE TEXT

To facilitate learning, the text uses an integrative approach with a logical flow from one topic to the next. Whenever possible, the material in one section is related and integrated with material in other sections. Furthermore, students are asked to take an active role in the learning process.

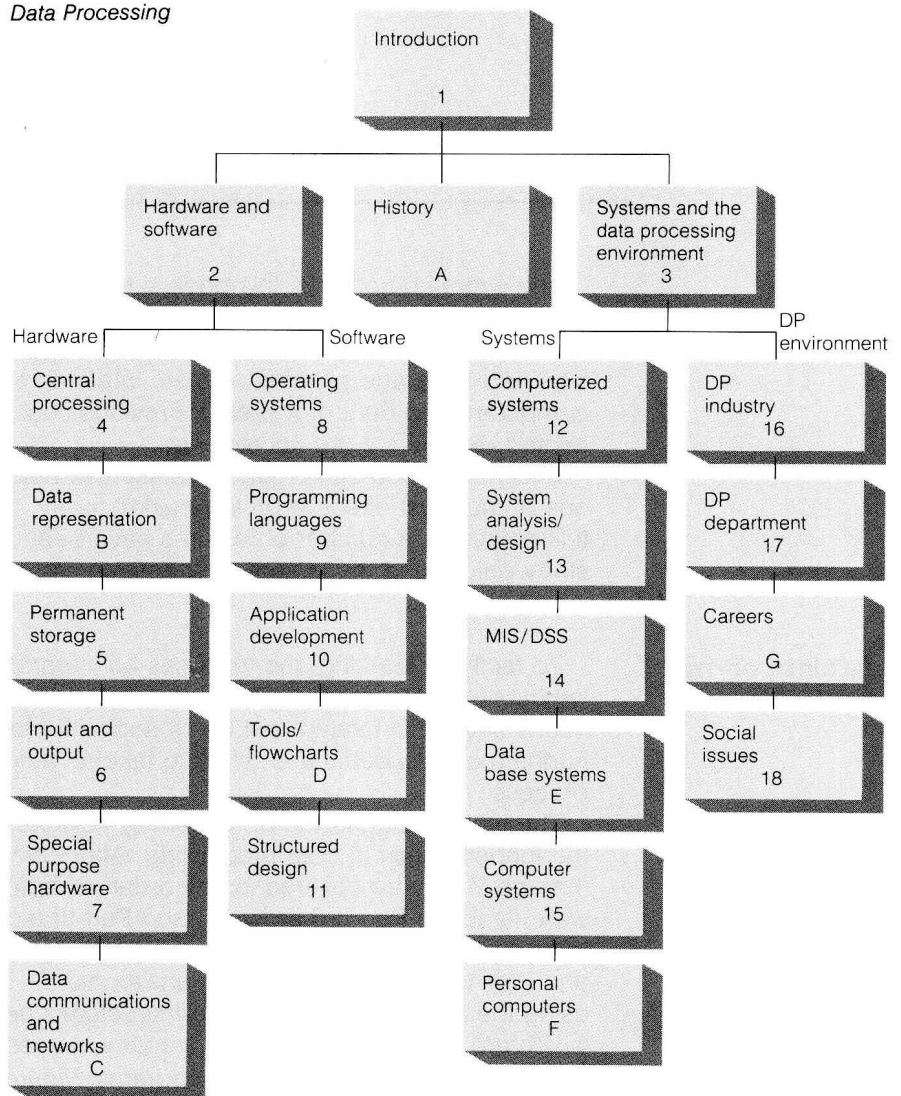

The text is designed to be extremely flexible. The first part covers the fundamentals of data processing. After completing Part I, Parts II through V may be covered in any order. Chapter 2 (hardware and software) leads to Part II (hardware) and Part III (software). Chapter 3 (systems and the data processing environment) leads to Part IV (systems) and Part V (the data processing environment). This book is designed using the *top down* approach and *structured design*. These concepts, which are covered in this book, are very successful techniques used to design computer systems and programs. Figure 1 portrays the organization and structure of the book.

A set of integrated cases at the end of the book ties together the chapters for each part and integrates the parts into a unified whole. One case is continued for every part. Students will be able to trace a growing company and experience some of the data processing problems that occur. Some of the cases are also continued in the instructor's manual. The overall approach is to apply what is learned to real situations.

Each chapter is designed to be a complete learning package. The chapter starts with a chapter outline and several learning objectives.

Figure 1

Structure chart for *Principles of Data Processing*

There are ample illustrations and pictures, and the writing style is simple and concise. A detailed summary is at the end followed by a list of key terms and concepts and a list of short answer questions. Following the questions, there is a miniquiz which is self-correcting. The miniquiz tests students on the knowledge they have acquired and the extent to which they have satisfied the learning objectives. There is at least one item of interest in each chapter. This item of interest is either an article from a newspaper or journal, a quotation from a key executive in the

data processing industry, or an actual success story of how a profit or nonprofit organization was able to successfully use a computer system. These items of interest have been selected to strengthen a point made in the chapter and to increase student interest in data processing in general.

This book also contains several support modules to various chapters. These support modules explore careers in data processing, discuss important social issues, cover the use of inexpensive microcomputers, or investigate computer numbering systems and data representation. These support modules can be covered or omitted without loss of continuity depending upon the purpose of the course and the desires of the instructor.

**A NOTE TO
STUDENTS ON HOW
TO USE THE TEXT
AND SUPPLEMENTS**

How you use this text depends in part upon the instructor. There is great flexibility in designing the course and in using the materials in this package. Your instructor will decide whether or not you will need the student learning aid or one or more of the language supplements. Once the supplements and materials to be used have been determined, it will be your responsibility to get the most from the assigned work. Here are some hints.

After a chapter or support module has been assigned in the text, you should first look at the chapter outline. This will give you an overview of the major topics that will be discussed. Next, you should read and make a note of the learning objectives. At the end of the chapter or support module, you will be expected to have accomplished these objectives. While you are reading the chapter or support module, you may wish to place your own notes in the margin. After reading the material, review the key terms and concepts and do all of the end-of-chapter questions and exercises. If you believe you understand the material, try the miniquiz. Once you have completed all of this, you might want a final review before reading new material. The best way to do this is to review the outline, the learning objectives, the questions, and the key terms and concepts. This review process will help you retain the material for future use.

Your learning should not be limited to this text or the courses you are taking. Take an active part in your education. Read newspaper and magazine articles that describe how the computer has been used in your field. Computer manufacturers are willing to supply students with information on a number of subjects related to data processing and computers. If the local branch does not have the information, ask for the address and phone number of the national office. These companies realize you may be a future employee or customer, and they are willing to help you. You may also want to talk to several local companies about how they use computers in business. This could give you some excellent contacts for future employment.

HOW THIS BOOK WAS WRITTEN

The writing and publication of this book used computerization at every stage. Using a microcomputer and word processing, the entire book was placed on a few small floppy disks. The book was carefully checked and edited. Both students and professors helped by providing suggestions, which were incorporated into the book and the floppy disks. A special program was used to check spelling. Another program was used to check basic grammar. Then the book was sent to the publisher for further checks and entered into production. A typesetter, using a large computer, transferred the chapters from the floppy disks to large disk devices. Further checks and a few minor modifications were made. Special typesetting programs were then used to transfer the chapters on the large disks into the book you are now reading.

ACKNOWLEDGMENTS

I am indebted to a number of organizations that freely gave me information, pictures, brochures, and encouragement. Bill Anthony, the Department of Management, and the College of Business at Florida State University gave the support I needed to complete this project. I am also indebted to Ralph Janaro, John Malley, Roger McGrath, and Bill Walker for taking major responsibility in developing the language supplements and in making suggestions for the improvement of the text and accompanying materials. Diane Dyer helped by coordinating much of the typing and clerical work associated with this book. Thanks to David Kirkland, Henrietta Holmes, Cathy Seery, Betty K. Smith, and Elaine Martin for their help.

Special thanks goes to my typing team that placed this manuscript on the IBM Personal Computer using WordStar. This team consisted of Rhonda Bratcher, Robin Woods, Lisa Justice, Cathy Wesley, and Beverly Taku.

I would also like to thank my wife, Lila, for taking a very active role in this project.

I am grateful to a number of individuals for reviewing the text and accompanying materials and for providing useful suggestions. Claude McMillan and Robert Fetter made many useful suggestions. Some of the other reviewers that I am indebted to include: Professor W. James Abbott, Jr., Broome Community College; Professor Tanya Burke, Oxnard College; Professor Peter L. Irwin, Richland College; Professor Robert Keim, Arizona State University; Ms. Vicky Crittenden, Florida State University; and Professor Robert J. Condon, Westchester Community College.

Those who completed the questionnaire pertaining to the introductory data processing course which was provided to the author during the revision of this textbook are: Professor Larry Arp, Indiana State University, Evansville; Professor L. Green, Durham Technical Institute; Professor Joseph Cebula, Community College of Philadelphia; David B. Newhall, North Shore Community College; Professor John Shepherd,

Indiana University of Pennsylvania; Professor Richard J. Kapperman, El Camino College; Professor William R. Kenney, San Diego Mesa Junior College; Professor Angelo De Cesaris, King's College; Professor Herbert F. Rebhun, University of Houston, Downtown College; Professor Carol Rowey, Community College of Rhode Island, Flanagan; Professor Stanley J. Birkin, University of South Florida; Professor Marilyn Meyers, California State University; Sister Carolyn Therese, Seton Hall University; Sister Marilyn Therese, Seton Hall University; Professor Carol Hershberger, Olympic College; Professor Duane Braaten, Mankato State University; Professor Anthony Basilico, Community College of Rhode Island; Professor Isaak Benbasat, University of British Columbia; Professor Barry Shore, University of New Hampshire; Professor Monte J. Johnson, St. Cloud State University; and Professor Laura Saret, Oakton Community College.

AMERICAN EXPRESS

The concepts presented in any introductory course are many and varied. This is certainly true of any introductory course in data processing. It can be very difficult for students to pull these concepts together. It can also be difficult for students to comprehend how various concepts and materials are applied in actual organizations. To overcome these difficulties, we will show you how a large and successful organization has efficiently and effectively employed data processing facilities.

The company we will feature in this book is American Express Travel Related Services Company, Inc. (referred to in this book as American Express). In most chapters, you will see how the concepts you are learning have been implemented by American Express. This will give you the unique opportunity to see how one company uses hardware, software, data bases, data processing personnel, and operational procedures to its benefit.

During the course of this text, use is made of a number of American Express (and its affiliated companies) trademarks, service marks, and copyrighted material in addition to those marks specified below. This use is made with the knowledge and permission of American Express for this limited purpose alone. Appropriate notice as required by law has been affixed to denote the cited marks and copyrighted material.

American Express® and Gold Card® are registered service marks of American Express.

"Don't leave home without it"® is a registered service mark of American Express, certificate of registration 1,151,224.

I would like to thank Jim Welch, Terry Smith, Bob Lemker, Mike Connolly, Jim Kravit, Joseph Rosenbaum, and many others at American Express for their help in developing this material.

CONTENTS

PART I

FUNDAMENTALS

1. Information and data processing 4

Computers in action. Information and data processing. Data processing and organizations. Data organization and movement: *Data organization. Data movement. Data processing alternatives.* An analogy: *The components of a manual data processing system. Placing a manual data processing system into action. The analogy and computer systems.*

American Express: Introduction, 19

2. The fundamentals: Hardware and software 22

Hardware: *The analogy revisited. The central processor and temporary storage. Permanent storage. Input. Output: The printer. Computer configurations.* Software: *The analogy revisited. Overview of software. Application software. System software.*

American Express: Hardware and software, 46

3. Putting it together: Systems and the data processing environment 48

Capabilities and limitations of a computer system. Common elements of a computer application: *Editing. Updating. Common outputs from a computer application.* Routine applications and documents. Management information: *Management information in perspective. Characteristics of a management information system.*

Types of management reports. How much information? The data processing environment: The data processing industry. The data processing department. Social issues.

American Express: Systems and the data processing environment, 67

Support module A: The evolution of data processing systems 70

Mechanical devices. The beginning of the computer age. The computer generations: *The first generation. The second generation. The third generation. The fourth generation to the present. The start of the fifth generation.* The future: *Technology. Applications.*

PART II

HARDWARE

4. Central processing 92

The control and arithmetic/logic unit: *The control unit. The arithmetic/logic unit. Registers and cache memory. Array processors. The execution of an instruction.* Memory: *Fundamentals of memory (temporary storage). Core storage. Semiconductor storage. Bubble storage. Other memory devices.* Characteristics of central processing units. Interfacing with other components.

American Express: Central processing, 111

Support module B: Data representation 114

Decimal and binary systems. The octal numbering system. The hexadecimal numbering system. Binary coded decimal systems. Parity checking.

5. Permanent storage devices 128

Fundamentals of permanent storage devices. The card system: *Card concepts. Card devices.* The tape system: *Tape concepts. Tape devices.* The disk system: *Disk concepts. Disk devices.* A comparison of permanent storage devices: *The card system. The tape system. The disk system.*

American Express: Permanent storage devices, 151

6. Input and output devices 152

Data entry devices: *Key to storage. Multistation data entry systems. Validation, verification, and editing.* Printers: *Impact printers. Non-impact printers. Intelligent printers. Factors in selecting a printer.* Terminals: *Visual display terminals. Teleprinter terminals. Smart and intelligent terminals. Factors in selecting a terminal.*

American Express: Input and output, 174

7. Special purpose hardware 176

Input devices: *Magnetic ink character recognition. Optical data readers. Industrial data collection. Portable data entry. Digitizers. Speech recognition. Other input devices.* Output devices: *Plotters. Computer output microfilm. Computer output mailing. Facsimile. Audio response. Other output devices.* Devices for input and output: *Telephone. Point of sale and universal product code. Electronic funds transfer. The use of graphics.* Permanent storage and central processing: *Mass storage devices. Central processing devices.*

American Express: Special purpose hardware, 201

Support module C: Data communications and networks 202

Carriers and communication devices: *Carriers. Classifying carriers. Providers of carriers and services. Communication devices. Concentrators and multiplexers.* Communications software. Networks: *Local area networks. Security and privacy concerns.*

American Express: Data communications, 221

PART III

SOFTWARE

**8. Operating and system software 224**

Batch processing. Transaction processing. Overlapped processing. Real-time processing. Multiprocessing. Spooling. Multiprogramming. Virtual storage. Virtual systems. Program overlays. Special purpose system software: *System translators. System simulators.*

American Express: Operating and system software, 244

9. Programming languages 246

Programming languages in perspective. Statement structures. The BASIC programming language. The FORTRAN programming language. The COBOL programming language: *The structure of a COBOL program. The identification division. The environment division. The data division. The procedure division.* The Pascal programming language. The Ada programming language. Other programming languages: *RPG. PL/1. APL. Data base and query languages. Special purpose programming languages.* The future: Natural and intelligent languages. Trends in programming languages. Language comparison.

American Express: Programming languages, 271

10. Program and application development 272

Developing application software: *1. Problem definition. 2. Analysis and design. 3. Language selection. 4. Program coding. 5. Testing and debugging. 6. Documentation. 7. Implementation. 8. Maintenance. Software automation.* Purchasing application software. Software performance measurement.

American Express: Program and application development, 291

Support module D: Tools for program and application development 294

Print charts and layout charts. Screen layout charts. Flowcharts: *System flowcharts. Program flowcharts. Problems with flowcharts.* Decision tables. Grid charts.

American Express: Tools for program and application development, 312

11. Structured design 316

The structured design approach: *Structure charts. Organization and design guidelines. HIPO: Visual table of contents. HIPO diagrams.* Structured programming concepts: *Structured programming. Structured flowcharting. Pseudocode. Writing structured programs.* Managing structured systems: *Chief-programmer teams. Structured walk-throughs.* Implementing a structured system: *The top-down approach. Other implementation techniques.*

American Express: Structured design, 341

PART IV

SYSTEMS

12. Computerized systems and applications 346

Accounting: *Invoicing. Accounts receivable. Accounts payable. Payroll. Inventory control. General ledger.* Banking and financial institutions: *Check processing. Commercial loans. Credit card administration. Savings and time deposits. Bill-paying systems. Stock and bond management. Automatic teller. Electronic funds transfer.* Manufacturing: *Customer order system. Master production scheduling. Inventory control. Computer assisted manufacturing and design. Quality control and testing.* Marketing: *Marketing research. Product development and reporting. Place analysis. Promotion analysis. Price analysis and sales projection.* Office automation: *Word pro-*

cessing. Electronic mail. Voice storage and forwarding. Local area networks. Facsimile. Teleconferencing. Putting it all together.

American Express: Computerized systems and applications, 367

13. Systems analysis and design 370

Systems investigation. Systems analysis: *General evaluation considerations. Assembling the study team. Data collection. Data analysis. Report on the existing system.* Systems design: *Interactive design considerations. General design considerations. Generating system design alternatives. System evaluation and selection. The contract.* Systems implementation: *Software acquisition and development. Personnel: Hiring and training. Site preparation. Data preparation. Installation. Final testing. Start-up. Maintenance.* Buying system methodology.

American Express: Systems analysis and design, 394

14. Management information and decision support systems 396

MIS and DSS in perspective. The evolution of DSS. The information resource. The system life cycle. The systems framework: *The systems approach. The use of models. General model of the organization. Theory of management.* The functional approach. The strategic information center. Design and implementation considerations.

American Express: Management information and decision support systems, 417

Support module E: Data base systems 418

General concepts: *Pointers. Chains. Indexes or inverted lists.* Data structures: *Hierarchical or tree structures. Network structures. Relational structures.* Data base management systems: *Setting up a data base management system. Using a data base management system.* Managing data base systems.

American Express: Data base systems, 436

15. Computer systems 438

Microcomputers. Minicomputers. Small computer systems. Medium and large computer systems. Centralized, decentralized, and distributed systems.

American Express: Computer systems, 459

Support module F: Personal computers 462

Personal computer systems in action: *Individual applications. Professional and business applications. Applications in education.*
