Preface to the Second Edition

The objectives and organization of the second edition remain essentially unchanged. The major difference from the first edition is the inclusion of new material on topics such as dendrimers, polymer recycling, Hansen solubility parameters, nanocomposites, creep in glassy polymers, and twin-screw extrusion. New examples have been introduced throughout the book, additional problems appear at the end of each chapter, and references to the literature have been updated. Additional text and figures have also been added.

The first edition has been successfully used in universities around the world, and we have received many encouraging comments. We hope the second edition will also find favor with our colleagues, and be useful to future generations of students of polymer science and engineering.

Anil Kumar

Rakesh K. Gupta

Preface to the First Edition

Synthetic polymers have considerable commercial importance and are known by several common names, such as plastics, macromolecules, and resins. These materials have become such an integral part of our daily existence that an introductory polymer course is now included in the curriculum of most students of science and engineering. We have written this book as the main text for an introductory course on polymers for advanced undergraduates and graduate students. The intent is to provide a systematic coverage of the essentials of polymers.

After an introduction to polymers as materials in the first two chapters, the mechanisms of polymerization and their effect on the engineering design of reactors are elucidated. The succeeding chapters consider polymer characterization, polymer thermodynamics, and the behavior of polymers as melts, solutions, and solids both above and below the glass transition temperature. Also examined are crystallization, diffusion of and through polymers, and polymer processing. Each chapter can, for the most part, be

read independently of the others, and this should allow an instructor to design the course to his or her own liking. Note that the problems given at the end of each chapter also serve to complement the main text. Some of these problems cite references to the literature where alternative viewpoints are introduced. We have been teaching polymer science for a long time, and we have changed the course content from year to year by adopting and expanding on ideas of the kind embodied in these problems.

Since polymer science is an extremely vast area, the decision to include or exclude a given subject matter in the text has been a difficult one. In this endeavor, although our own biases will show in places, we have been guided by how indispensable a particular topic is to proper understanding. We have attempted to keep the treatment simple without losing the essential features; for depth of coverage, the reader is referred to the pertinent technical literature. Keeping the student in mind, we have provided intermediate steps in most derivations. For the instructor, lecturing becomes easy since all that is contained in the book can be put on the board. The future will tell to what extent we have succeeded in our chosen objectives.

We have benefited from the comments of several friends and colleagues who read different parts of the book in draft form. Our special thanks go to Ashok Khanna, Raj Chhabra, Deepak Doraiswamy, Hota V. S. GangaRao, Dave Kofke, Mike Ryan, and Joe Shaeiwitz. Professor Khanna has used the problem sets of the first seven chapters in his class for several years.

After finishing my Ph.D. from Carnegie-Mellon University, I (Anil Kumar) joined the Department of Chemical Engineering at the Indian Institute of Technology, Kanpur, India, in 1972. My experience at this place has been rich and complete, and I decided to stay here for the rest of my life. I am fortunate to have a good set of students from year to year with whom I have been able to experiment in teaching various facets of polymer science and modify portions of this book continuously.

Rakesh Gupta would like to thank Professor Santosh Gupta for introducing polymer science to him when he was an undergraduate student. This interest in polymers was nurtured by Professor Art Metzner and Dr. K. F. Wissbrun, who were his Ph.D. thesis advisors. Rakesh learned even more from the many graduate students who chose to work with him, and their contributions to this book are obvious. Kurt Wissbrun reviewed the entire manuscript and provided invaluable help and encouragement during the final phases of writing. Progress on the book was also aided by the enthusiastic support of Gene Cilento, the Department Chairman at West Virginia University. Rakesh adds that these efforts would have come to nought without the determined help of his wife, Gunjan, who guarded his spare time and allowed him to devote it

entirely to this project. According to Rakesh, “She believed me when I told her it would take two years; seven years later she still believes me!”

I doubt that this book would ever have been completed without the constant support of my wife, Renu. During this time there have been several anxious moments, primarily because our children, Chetna and Pushkar, were trying to choose their careers and settle down. In taking care of them, my role was merely helping her, and she allowed me to divide my attention between home and work. Thank you, Renu.

Contents

<i>Preface to the Second Edition</i>	v
<i>Preface to the First Edition</i>	vii
1. Introduction	1
1.1 Defining Polymers	1
1.2 Classification of Polymers and Some Fundamental Concepts	4
1.3 Chemical Classification of Polymers Based on Polymerization Mechanisms	16
1.4 Molecular-Weight Distributions	19
1.5 Configurations and Crystallinity of Polymeric Materials	22
1.6 Conformation of Polymer Molecules	27
1.7 Polymeric Supports in Organic Synthesis	29
1.8 Conclusion	38
	xi

References	39
Problems	39
2. Effect of Chemical Structure on Polymer Properties	45
2.1 Introduction	45
2.2 Effect of Temperature on Polymers	45
2.3 Additives for Plastics	50
2.4 Rubbers	61
2.5 Cellulose Plastics	66
2.6 Copolymers and Blends	68
2.7 Cross-Linking Reactions	72
2.8 Ion-Exchange Resins	80
2.9 Conclusion	89
References	90
Problems	91
3. Step-Growth Polymerization	103
3.1 Introduction	103
3.2 Esterification of Homologous Series and the Equal Reactivity Hypothesis	105
3.3 Kinetics of A-R-B Polymerization Using Equal Reactivity Hypothesis	107
3.4 Average Molecular Weight in Step-Growth Polymerization of ARB Monomers	111
3.5 Equilibrium Step-Growth Polymerization	116
3.6 Molecular-Weight Distribution in Step-Growth Polymerization	118
3.7 Experimental Results	125
3.8 Conclusion	140
Appendix 3.1: The Solution of MWD Through the Generating Function Technique in Step-Growth Polymerization	140
References	143
Problems	145
4. Reaction Engineering of Step-Growth Polymerization	153
4.1 Introduction	153

4.2	Analysis of Semibatch Reactors	156
4.3	MWD of ARB Polymerization in Homogeneous Continuous-Flow Stirred-Tank Reactors	166
4.4	Advanced Stage of Polymerization	169
4.5	Conclusion	174
	Appendix 4.1: Similarity Solution of Step-Growth Polymerization in Films with Finite Mass Transfer	175
	References	181
	Problems	181
5.	Chain-Growth Polymerization	188
5.1	Introduction	188
5.2	Radical Polymerization	192
5.3	Kinetic Model of Radical Polymerization	197
5.4	Average Molecular Weight in Radical Polymerization	199
5.5	Verification of the Kinetic Model and the Gel Effect in Radical Polymerization	201
5.6	Equilibrium of Radical Polymerization	210
5.7	Temperature Effects in Radical Polymerization	215
5.8	Ionic Polymerization	216
5.9	Anionic Polymerization	222
5.10	Ziegler-Natta Catalysts in Stereoregular Polymerization	226
5.11	Kinetic Mechanism in Heterogeneous Stereoregular Polymerization	230
5.12	Stereoregulation by Ziegler-Natta Catalyst	232
5.13	Rates of Ziegler-Natta Polymerization	233
5.14	Average Chain Length of the Polymer in Stereoregular Polymerization	238
5.15	Diffusional Effect in Ziegler-Natta Polymerization	240
5.16	Newer Metallocene Catalysts for Olefin Polymerization	242
5.17	Conclusion	244
	References	244
	Problems	248
6.	Reaction Engineering of Chain-Growth Polymerization	255
6.1	Introduction	255
6.2	Design of Tubular Reactors	256
6.3	Copolymerization	273

6.4	Recycling and Degradation of Polymers	285
6.5	Conclusion	287
