Preface

Embedded systems now include a very large proportion of the advanced products designed in the world, spanning transport (avionics, space, automotive, trains), electrical and electronic appliances (cameras, toys, televisions, home appliances, audio systems, and cellular phones), process control (energy production and distribution, factory automation and optimization), telecommunications (satellites, mobile phones and telecom networks), and security (e-commerce, smart cards), etc. The extensive and increasing use of embedded systems and their integration in everyday products marks a significant evolution in information science and technology. We expect that within a short timeframe embedded systems will be a part of nearly all equipment designed or manufactured in Europe, the USA, and Asia.

There is now a strategic shift in emphasis for embedded systems designers: from simply achieving feasibility, to achieving optimality. Optimal design of embedded systems means targeting a given market segment at the lowest cost and delivery time possible. Optimality implies seamless integration with the physical and electronic environment while respecting real-world constraints such as hard deadlines, reliability, availability, robustness, power consumption, and cost. In our view, optimality can only be achieved through the emergence of embedded systems as a discipline in its own right.

Embedded systems are of strategic importance in modern economies. They are used in mass-market products and services, where value is created by supplying either functionality or quality. Europe currently has a strong position in sectors where embedded technologies play a central role. It has a lead in civil avionics where fly-by-wire technology provides an overwhelming competitive advantage in the cost of operating aircraft. Europe is also well positioned in the space sector, specifically for launch vehicles and satellites. In the automotive industry, European manufacturers and their suppliers enjoy a leading technological advantage for engine control, and emerging technologies such as brake-by-wire and drive-by-wire. Railway signalling in Europe relies on embedded systems, and allows faster, safer, and heavier traffic. Embedded applications will be extensively used to make energy distribution more flexible, especially in view of the coming market liberalization. Embedded technologies are strategic for the European telecommunications sector. Finally, Europe is also well positioned for e-services (e-banking, e-health, e-training), based on the leading edge in smart-card related technologies.

Embedded systems design raises challenging problems for research, including:

- Security
Economic, citizenship, and societal activities in Europe rely increasingly on embedded applications. Widespread acceptance and reliance on these will depend on the availability of seamless solutions for securing rights and privacy.
- Reliable, mobile, embedded services
Electronic commerce and e-services in a wireless world will need provably correct foundations to ensure further growth.

- **Large-scale heterogeneous distributed systems**
Applications such as automated highways, advanced air traffic control, or next-generation factory automation require full-scale, industry-ready paradigms, methodologies, and advanced prototypes. These need to integrate heterogeneous elements from different, perhaps competing providers, in evolving embedded environments.
- **Adaptive embedded systems**
Tomorrow's resource-constrained applications, such as image processing, telecommunications, and industrial automation, are expected to see drastic advances in performance and dependability, with the ability to adapt to dynamic changes in resource needs, including power/energy, bandwidth, memory, and computing power.
- **Component-based design, validation, and tool-based certification**
Development costs and time-to-market could be vastly reduced, by enabling the incremental design and formal validation of arbitrarily complex systems.

This roadmap was written by the IST-2001-34820 ARTIST FP5 Accompanying Measure on Advanced Real-Time Systems, funded by the European Commission, and which started April 1st, 2002 and ended March 31st 2005.

The ARTIST FP5 workplan includes, in addition to providing this roadmap, advancing the state of the art and structuring research on embedded systems in Europe. It gathered together 28 leading European research institutions, as well as many top researchers in the area.

The aim of ARTIST FP5 was to coordinate the R&D effort in the area, to improve awareness of academics and industry, especially about existing innovative results and technologies, standards, and regulations, and to define innovative and relevant work directions, identify obstacles to scientific and technological progress, and propose adequate strategies for circumventing them.

ARTIST FP5 was implemented as a set of four coordinated actions, each centred on a high-priority thematic area of research on embedded systems. Correspondingly, the roadmap is organised into four parts.

Action 1: Hard Real Time. This action was led by Professor Albert Benveniste of INRIA (France), and focused on aspects of hard real-time applications, bringing together competencies from synchronous languages, time-triggered systems, and schedulers.

Action 2: Component-Based Design and Development. This action was led by Professor Bengt Jonsson of Uppsala University (Sweden), and focused on both theoretical and practical aspects of modelling complex systems with emphasis on methods (compositionality, composability) and standards (e.g. UML).

Action 3: Adaptive Real-Time Systems for QoS Management. This action was led by Professor Giorgio Buttazzo of the University of Pavia (Italy), and focused on soft real-time approaches and technology for telecommunications, large open systems, and networks. It gathered together teams with expertise in real-time operating systems and middleware.

Action 4: Execution Platforms. This action was led by Professor Lothar Thiele of the Swiss Federal Institute of Technology (ETHZ), and focused on issues at the frontier between hardware and software – and their implications for embedded systems design.

To enhance readability, each of the four parts of the roadmap follows a similar structure, although there are domain-related specificities. Also, inevitably, some topics may be treated in more than one part of the document, but the index should help the reader find the different relevant texts for a given topic.

Oversight for ARTIST FP5 was provided by the Artist Industrial Advisory Board (IAB), which reviewed the roadmap. The ARTIST IAB is chaired by Dr. Dominique Potier, Scientific Director for Software Technologies, Thalès.

We would like to thank all the contributors to the roadmap, including the engineers and researchers who participated in the various technical meetings and workshops, as well as the industrial leaders who granted interviews and/or provided information in the questionnaire. Special thanks also go to the Artist FP5 reviewers and the project officer, for constructive and stimulating comments.

The elaboration of this roadmap provided the opportunity for fertile interaction between key players in the area of embedded systems, and proved to be useful for structuring the area.

The work and the strategic orientations and conclusions of ARTIST FP5 led to the creation of the ARTIST2 FP6 Network of Excellence on Embedded Systems Design. Information about ARTIST2 is available on the web-site: <http://www.artist-embedded.org/FP6>.

This roadmap usefully complements other existing roadmapping work from ITEA and MEDEA+. We hope that it will be useful for both research and industry and that it will serve to advance awareness about the state of the art and provide insights on possible avenues for R&D.

Table of Contents

Part I: Hard Real-Time Development Environments

1	Executive Overview on Hard Real-Time Development Environments.....	1
1.1	Motivation and Objectives	1
1.2	Essential Characteristics.....	2
1.3	Role in Future Embedded Systems	3
1.4	Overall Challenges and Work Directions.....	4
1.5	Document Structure	9
2	Hard Real-Time System Development.....	10
2.1	Brief Discussion of Current Practice: The V-Shaped Lifecycle.....	10
2.2	An Emerging Approach: Platform-Based Design	11
3	Current Design Practice and Needs in Selected Industrial Sectors.....	15
3.1	Automotive Systems	15
3.2	Aeronautics: A Case Study	24
3.3	Consumer Electronics: A Case Study	31
3.4	Automation Applications	35
4	Tools for Requirements Capture and Exploration	39
4.1	Definitions of Hard Real-Time Dependability Features.....	39
4.2	Scientific Engineering Tools and Physical Systems Modellers	45
4.3	State-Based Design: Dealing with Complex Discrete Control.....	50
5	Tools for Architecture Design and Capture.....	54
6	Tools for Programming, Code Generation, and Design	63
6.1	Structure	63
6.2	Code Generation from Synchronous Languages	63
6.3	Back-End Code Generation – Below C.....	68
7	Tools for Verification and Validation	72
7.1	Building Blocks for Verification and Validation	72
7.2	Model Checking	72
7.3	Static Program Analysis.....	76
7.4	Testing Embedded Systems	80
8	Middleware for Implementing Hard Real-Time Systems.....	85

9	Review of Some Advanced Methodologies	92
9.1	The Setta Project	92
9.2	The SafeAir Project.....	96

Part II: Component-Based Design and Integration Platforms

10	Executive Overview on Component-Based Design and Integration Platforms	103
10.1	Motivation and Objectives	104
10.2	Essential Characteristics.....	105
10.3	Role in Future Embedded Systems	108
10.4	Overall Challenges and Work Directions.....	109
10.5	Document Structure	112
11	Component-Based System Development	114
11.1	Lifecycle of Component-Based Systems.....	114
11.2	Lifecycle of Components	117
11.3	Issues Specific for Embedded Systems	117
11.4	Summary and Conclusions.....	118
12	Current Design Practice and Needs in Selected Industrial Sectors.....	120
12.1	Automotive.....	120
12.2	Industrial Automation	124
12.3	Consumer Electronics	129
12.4	Telecommunication Software Infrastructure.....	131
12.5	Avionics and Aerospace.....	134
12.6	Summary and Challenges.....	136
13	Components and Contracts.....	139
13.1	Introduction	139
13.2	Level 1 – Syntactic Interfaces	140
13.3	Level 2 – Functional Properties.....	143
13.4	Level 3 – Functional Properties.....	145
13.5	Level 4a – Timing Properties	147
13.6	Level 4b – Quality of Service	153
13.7	Specifying and Reasoning About Contracts: Summary and Analysis.....	158
14	Component Models and Integration Platforms: Landscape.....	160
14.1	Widely Used Component Models	160
14.2	Component Models for Embedded System Design.....	172

14.3	Integration Platforms for Heterogeneous System Design	181
14.4	Hardware/Software Modelling Languages.....	186
14.5	Component Models and Integration Platforms: Summary and Conclusions.....	187
14.6	Component Libraries: Approaches to Component Retrieval.....	189
15	Standardization Efforts.....	194
15.1	Specification Standards.....	194
15.2	Implementation Technology Standards.....	202
15.3	Conclusions and Challenges.....	203
16	References	204

Part III: Adaptive Real-Time Systems for Quality of Service Management

17	Executive Overview on Adaptive Real-Time Systems for Quality of Service Management	216
17.1	Motivation and Objectives	216
17.2	Essential Characteristics.....	217
17.3	Role in Future Embedded Systems	218
17.4	Overall Challenges and Work Directions.....	220
17.5	Document Structure	225
18	Adaptive Real-Time System Development	227
19	Current Design Practice and Needs in Selected Industrial Sectors.....	229
19.1	Industrial Sector 1: Consumer Electronics in Philips.....	229
19.2	Industrial Sector 2: Industrial Automation.....	232
19.3	Industrial Sector 3: Consumer Electronics: Ericsson Mobile Platforms	237
19.4	Industrial Sector 4: Telecommunications – The PT-Inovação Case Study.....	240
20	Real-Time Scheduling.....	242
20.1	Landscape.....	242
20.2	Assessment.....	248
20.3	Trends.....	248
20.4	Recommendations for Research.....	252
20.5	References	254
21	Real-Time Operating Systems.....	258
21.1	Landscape.....	259
21.2	Assessment.....	275

21.3	Trends.....	279
21.4	Recommendations for Research.....	282
21.5	References.....	283
22	QoS Management.....	287
22.1	Landscape.....	287
22.2	Assessment.....	294
22.3	Trends.....	295
22.4	Recommendations for Research.....	299
22.5	References.....	300
23	Real-Time Middleware.....	305
23.1	Landscape.....	306
23.2	Assessment.....	310
23.3	Trends.....	311
23.4	Recommendations for Research.....	313
23.5	References.....	314
24	Networks	316
24.1	Landscape.....	316
24.2	Assessment.....	325
24.3	Trends.....	326
24.4	Recommendations for Research.....	333
24.5	References.....	335
25	Programming Languages for Real-Time Systems	338
25.1	Landscape.....	338
25.2	Assessment.....	344
25.3	Trends.....	346
25.4	Recommendations for Research.....	347
25.5	References.....	349
26	Other Issues	352
26.1	Power Awareness	352
26.2	Media-Processing Applications.....	358
26.3	Integrating Real-Time and Control Theory.....	358
26.4	Probabilistic Time Analysis	365
26.5	Hardware Trends.....	369

Part IV: Execution Platforms

27	Executive Overview on Execution Platforms	373
27.1	Motivation and Objectives	373
27.2	Essential Characteristics.....	374
27.3	Role in Future Embedded Systems	374
27.4	Overall Challenges and Work Directions.....	374
27.5	Document Structure	375
28	Current Design Practice and Needs in Selected Sectors.....	377
28.1	Automotive Industry	377
28.2	Mechatronics Industry.....	383
29	Computing Platforms	388
29.1	Multiprocessor Systems – Modelling and Simulation.....	388
29.2	Distributed Embedded Real-Time Systems – Analysis and Exploration.....	406
29.3	Reconfigurable Hardware Platforms	423
29.4	Software Integration – Automotive Applications.....	440
30	Low Power Engineering	450
30.1	Power-Aware and Energy Efficient Middleware	450
30.2	Memory Hierarchy and Low Power Embedded Processors	464
