Jacob Bear

Jacob Bear is one of the world's foremost hydrologists. Presently, he has 67 publications to his credit and is Professor of Hydrology and Deputy Vice President at the Technion-Israel Institute of Technology in Haifa, where he has also been head of both the Hydraulics Laboratory and the Water Resources Research Center. In addition to his years at the Technion, Dr. Bear has taught and developed courses in hydrology at the Massachusetts Institute of Technology, the University of California at Berkeley, the University of Wisconsin, Princeton University, and New Mexico Institute of Mines and Technology. He has also been a planning engineer, a hydrologist, and a consultant on hydrology to Water Planning for Israel Ltd., the Ministry of Agriculture of Israel, and, most recently, Yalon-Balasha, consultants and engineers on large scale development projects in Iran and the Benue Plateau in Nigeria.

A native of Israel, Dr. Bear graduated with honors from the Technion in 1953, where he also received his Dipl. Eng. and M.Sc. degrees in 1954 and 1957 respectively. In 1960 he obtained his Ph.D at the University of California at Berkeley. His studies abroad include scholarships at the Hague and the University of California at Berkeley, and a three-month U.N. scholarship for a study tour in the Netherlands, France and the U.S.A.

Active in many related fields, Dr. Bear's memberships include the Israel Association of Geodesy and Geophysics, the International Association for Hydraulic Research, the National Committee of the Hydrological Decade, the editorial board of the *Israel Journal of Earth Sciences*, and Israel's Water Planning Committee. He has been chairman of the Hydrology Section of Israel Association of Geodesy and Geophysics, the National Committee of the Hydrological Decade, and the Section of Flow through Porous Media of the International Association for Hydraulic Research. A speaker at numerous international conferences, Dr. Bear's lectures include discussions on intercepting fresh water above the interface in a coastal aquifer, the optimal yield of an aquifer, hydrodynamic dispersion in porous media, immiscible displacement in fractured porous media, and hydrologic education in Israel.

Preface

This book is an attempt to present, in an ordered manner, the theory of dynamics (actually, also of statics) of fluids in porous media, as applicable to many disciplines of science and engineering. For some years I have taught courses on flow through porous media, and have treated this subject as a part of other courses, such as ground water hydrology, while at the Technion—Israel Institute of Technology, at M.I.T. where I spent my sabbatical leave (1966–7), and at several other institutions. I have felt the lack of a suitable textbook on this subject. Ideally, such a text should start from first principles of fluid mechanics and mechanics of continua, should show the passage from the microscopic to the macroscopic level of treatment, should emphasize the special features of porous media, establish the macroscopic theory and then show how it is applied to cases of practical interest.

It is rather surprising that in spite of its importance in many fields of practical interest, such as petroleum engineering, ground water hydrology, agricultural engineering and soil mechanics, so small number of treatises is available on fluids in porous media. This circumstance is even more surprising in view of the vast amount of literature published on the subject in a number of scientific and engineering journals. Although dynamics of fluids in porous media could become an interesting interdisciplinary course serving several departments, I believe that the relatively small number of courses offered by universities on the subject is due in part to lack of a suitable textbook. To overcome this lack I prepared notes for my own classes, which I present here in the form of a book, hoping that it will serve others in a similar situation.

The book is designed primarily for advanced undergraduate students and for graduates in fields such as ground water hydrology, soil mechanics, soil physics, drainage and irrigation engineering, sanitary engineering, petroleum engineering and chemical engineering, where flow through porous media plays a fundamental role. The book, I hope, will also serve the needs of scientists and engineers already active in these fields, who require a sound theoretical basis for their work. The emphasis in this book is on understanding the microscopic phenomena occurring in porous media and on their macroscopic description. The reader is led to grasp the meanings of the various parameters and coefficients appearing in the macroscopic descriptions of problems of flow through porous media, and their actual determination, as well as the limitations and approximations inherent in their description. In each case, the objective is to achieve a clear formulation of the flow problem considered and a complete mathematical statement of it in terms of partial differential equations and a set of initial and boundary conditions. Once a flow problem is stated properly in mathematical terms, three methods of solution are possible in principle:— analytic

solution, numerical solution aided by high speed digital computers and solution by means of laboratory models and analogs. All three tools are described in this book. Typical examples of analytic solutions are scattered throughout the book, but no attempt is made to present a collection of a large number of solved problems. The principles of the numerical method of solution are presented, and a detailed description is given of laboratory models and analogs, their scaling and applications.

Mathematics is employed extensively and the reader is expected to have a good background in advanced engineering mathematics, including such subjects as vector analysis, Cartesian tensor analysis, partial differential equations and elements of the theory of functions.

No attempt is made to give a complete citation of all published literature or to indicate the first author on a particular subject. References selected for citation are those I think represent a more important point of view, are more appropriate from the educational point of view or are more readily available for the average reader.

Obviously a single book, even of this size, cannot include everything related to the subject treated. Although we consider porous media in general, the discussion is limited to media with relatively large pores, thus excluding clays and media with micropores or colloidal-size particles. Similarly, chemical and electrochemical surface phenomena are excluded. The discussion is restricted to Newtonian fluids.

With these objectives and limitations in mind, the book starts with examples of two important porous media: the ground water aquifer and the oil reservoir. An attempt is made to define porous media, and the continuum approach is introduced as a tool for treating phenomena in porous media. This requires the definition of a "representative elementary volume" based on the definition of porosity. Chapter 2 includes a summary of some important fluid and porous media properties. In chapter 3, the concepts of pressure and piezometric head are introduced. Chapter 4 starts with the definition of velocities and fluxes in a fluid continuum. Then the equations of conservation of mass, momentum and energy in a fluid continuum are presented, and using a porous medium conceptual model these equations are averaged to obtain the basic equations that describe flow through porous media: the equations of volume and mass conservation, including the equation of mass conservation of a species in solution (also called the equation of hydrodynamic dispersion), and the motion equation for the general case of an anisotropic medium and inhomogeneous fluid. Although the basic equations of motion and of mass conservation are developed from first principles in chapter 4, chapters 5 and 6 return to these topics, discussing them from a different point of view, perhaps more suitable for the reader who is less versed in fluid mechanics. Chapter 5 presents the equation of motion, starting from its original one-dimensional form (as suggested by Darcy on the basis of experiments), and extending it to three-dimensional flow, compressible fluids and anisotropic media. This chapter also contains a review of theoretical derivations of Darcy's law. My objectives in presenting this and similar reviews is to indicate research methods, such as the use of conceptual and statistical models. A section on the motion equation at high Reynolds numbers is also included.

In chapter 6, the control volume approach is introduced as a general tool for developing mass conservation equations. Special attention is devoted to deformable media. Also included in this chapter is the stream function and its relationship to the piezometric head. Once the continuity or mass conservation equations have been established, the next natural step is to consider the initial and boundary conditions. These are discussed in detail in chapter 7. Special attention is given to the phreatic surface boundary condition and to its description in the hodograph plane. The second part of this chapter contains a discussion on various analytic and numerical solution techniques.

Upon reaching this point, the reader should be able to state a problem of flow through porous media in terms of an appropriate partial differential equation and a set of initial and boundary conditions. He should also know the major methods of solution (analog solutions are discussed in chapter 11).

Chapter 8 deals with the problem of flow in unconfined aquifers. This is a problem often encountered in ground water hydrology and in drainage. The Dupuit assumptions are explained and employed to derive the continuity equations for unconfined flow. The hodograph method, as a tool for solving two-dimensional, steady phreatic flow problems, is discussed in detail with many examples. Several linearization techniques and solutions of the nonlinear equation of unconfined flow are also presented in this chapter.

In chapter 9 the discussion, hitherto confined to single-phase flow, is extended to polyphase flow in porous media, a topic of special interest in petroleum engineering. Starting from the fundamental concepts of saturation, capillary pressure and relative permeability, the motion and continuity equations are established. The case of unsaturated flow as treated by soil physicists is presented as a special case of flow of immiscible fluids, where one of the fluids—the air—is stationary and at constant pressure. Special cases of interest, dealing with infiltration into soils, are considered in more detail. A new concept is introduced: that of an abrupt interface as an approximation replacing the actual transition zone that occurs between two fluids, whether miscible or immiscible. A detailed discussion is presented on the coastal interface, of great interest to ground water hydrologists.

Chapter 10 deals with hydrodynamic dispersion. Again, although the fundamental equation is developed from first principles in chapter 4, a review of several other theories leading to this equation is presented. Special attention is given to the coefficient of dispersion and its relationship to matrix and flow characteristics. A section on heat and mass transfer completes the discussion on hydrodynamic dispersion.

Chapter 11 presents the use of models and analogs, both as research tools and as tools for solving boundary value problems. Following the presentation of a general method for deriving analog scales, a detailed description is given of the sand box model, the electric analogs of various types, the Hele-Shaw analogs and the membrane analog. Recommendations for application are indicated in each case.

In brief, this is the subject matter I have chosen to cover in this book. I have made an effort to present the information in such a way as to require a minimum of supple-

mentary material, except for those who wish to dig more deeply into the subject. A large number of problems and exercises is included in this book.

I should like to express my appreciation to the many individuals who, through their comments and criticism, have contributed to the completion of this book. Special thanks are due to Dr. Y. Bachmat, Dr. C. Braester, Mr. E. A. Hefez and E. Goldshlager, for the help they have given me in reading, discussing and constructively criticizing the draft. Thanks are also due to the Department of Civil Engineering at M.I.T., and especially to Professor C. L. Miller, head of the department, Professor A. T. Ippen and Professor D. R. F. Harleman, who made it possible for me to write a large part of this book while spending a most fruitful year as a visiting professor at M.I.T.

The heaviest burden involved in writing this book was borne by my wife, Siona, who had to put up with the many inconveniences that are unavoidable when one is engaged in writing a book. For her constant encouragement to me throughout the various stages of writing, my hearty gratitude.

I realize that an attempt to represent a systematic account of a theory, such as I have made here, is bound to have defects. I will accept with gratitude all readers' suggestions directed toward the improvement of this book.

Haifa, Israel

Jacob Bear

Contents

Preface	xvii
CHAPTER 1	
Introduction	1
1.1 Aquifers, Ground Water and Oil Reservoirs	1
1.1.1 Definitions	1
1.1.2 The Moisture Distribution in a Vertical Profile	2
1.1.3 Classification of Aquifers	4
1.1.4 Properties of Aquifers	7
1.1.5 The Oil Reservoir	8
1.2 The Porous Medium	13
1.3 The Continuum Approach to Porous Media	15
1.3.1 The Molecular and Microscopic Levels	15
1.3.2 Porosity and Representative Elementary Volume	19
1.3.3 Areal and Linear Porosities	21
1.3.4 Velocity and Specific Discharge	22
1.3.5 Concluding Remarks	24
CHAPTER 2	
Fluids and Porous Matrix Properties	27
2.1 Fluid Density	27
2.1.1 Definitions	27
2.1.2 Mixture of Fluids	30
2.1.3 Measurement of Density	31
2.2 Fluid Viscosity	32
2.2.1 Definition	32
2.2.2 Non-Newtonian Fluids	33
2.2.3 Units	34
2.2.4 Effect of Pressure and Temperature	34
2.2.5 Measurement of Viscosity	35
2.3 Fluid Compressibility	37
2.4 Statistical Description of Porous Media	38
2.4.1 Particle-Size Distribution	39
2.4.2 Pore-Size Distribution	41
2.4.3 Other Statistical Descriptions	42

2.5 Porosity	43
2.5.1 Porosity and Effective Porosity	43
2.5.2 Porosity, Structure and Packing	45
2.5.3 Porosity Measurement	47
2.6 Specific Surface	50
2.6.1 Definitions	50
2.6.2 Measurement of Specific Surface	51
2.7 Matrix and Medium Compressibility	52

CHAPTER 3

Pressure and Piezometric Head	59
3.1 Stress at a Point	59
3.2 Hydrostatic Pressure Distribution	62
3.3 Piezometric Head	63

CHAPTER 4

The Fundamental Fluid Transport Equations in Porous Media	65
4.1 Particles, Velocities and Fluxes in a Fluid Continuum	65
4.1.1 Definitions of Particles and Velocities	65
4.1.2 Diffusive Velocities and Fluxes	68
4.1.3 The Eulerian and Lagrangian Points of View	70
4.1.4 The Substantial Derivative	71
4.2 The General Conservation Principle	74
4.3 Equations of Mass, Momentum and Energy Conservation in a Fluid Continuum	77
4.3.1 Mass Conservation of a Species	77
4.3.2 Mass Conservation of a Fluid System	78
4.3.3 Conservation of Linear Momentum of a Species α	79
4.3.4 Conservation of Linear Momentum of a Fluid System	80
4.4 Constitutive Assumptions and Coupled Processes	82
4.4.1 General Considerations	82
4.4.2 Principles to be Used in Forming Constitutive Equations	84
4.4.3 Coupled Processes	85
4.5 A Porous Medium Model	90
4.5.1 The Conceptual Model Approach	90
4.5.2 A Model of Flow Through a Porous Medium	92
4.5.3 Frames of Reference	93
4.5.4 An Averaging Procedure	95
4.6 Equations of Volume and Mass Conservation	98
4.6.1 Equation of Volume Conservation	98
4.6.2 Equation of Mass Conservation of a Species in Solution	100
4.6.3 Equation of Mass Conservation	102
4.7 Equation of Motion	104

4.8 Tortuosity and Permeability	106
4.8.1 Relationship Between Tortuosity and Permeability	106
4.8.2 Tortuosity and Other Transport Coefficients	112
4.8.3 Formation Factor and Resistivity Index (Amyx 1960) in Reservoir Engineering	113

CHAPTER 5

The Equation of Motion of a Homogeneous Fluid	119
5.1 The Experimental Law of Darcy	119
5.2 Generalization of Darcy's Law	122
5.2.1 Isotropic Medium	122
5.2.2 Anisotropic Medium	123
5.3 Deviations from Darcy's Law	125
5.3.1 The Upper Limit	125
5.3.2 The Lower Limit	127
5.3.3 The Slip Phenomenon	128
5.4 Rotational and Irrotational Motion	129
5.4.1 The Potential and Pseudopotential	129
5.4.2 Irrotational Flow	131
5.5 Hydraulic Conductivity of Isotropic Media	132
5.5.1 Hydraulic Conductivity and Permeability	132
5.5.2 Units and Examples	135
5.6 Anisotropic Permeability	136
5.6.1 The Principal Directions	137
5.6.2 Directional Permeability	143
5.7 Measurement of Hydraulic Conductivity	148
5.7.1 General	148
5.7.2 The Constant Head Permeameter	149
5.7.3 The Falling Head Permeameter	150
5.7.4 Determining Anisotropic Hydraulic Conductivity	150
5.8 Layered Porous Media	151
5.8.1 Flow Normal and Parallel to the Medium Layers	151
5.8.2 Equivalent Hydraulic Conductivity of Arbitrarily Directed Flow	155
5.8.3 A Layered Medium as an Equivalent Anisotropic Medium	156
5.8.4 Girinskii's Potential	157
5.9 Compressible Fluids	159
5.10 Derivations of Darcy's Law	161
5.10.1 Capillary Tube Models	162
5.10.2 Fissure Models	164
5.10.3 Hydraulic Radius Models	165
5.10.4 Resistance to Flow Models	167
5.10.5 Statistical Models	171
5.10.6 Averaging the Navier-Stokes Equations	173
5.10.7 Ferrandon's Model	175

5.11	Flow At Large Reynolds Numbers	176
5.11.1	The Phenomenon	176
5.11.2	Turbulence, Inertial Forces and Separation.	177
5.11.3	Some Examples of Proposed Nonlinear Motion Equations	182
5.12	Seepage Forces and Stresses	184
5.12.1	The Forces	184
5.12.2	Piping and Quicksand	186

CHAPTER 6

	Continuity and Conservation Equations for a Homogeneous Fluid	195
6.1	The Control Volume	195
6.2	Mass Conservation in a Nondeformable Porous Matrix	196
6.2.1	The Basic Continuity Equation	196
6.2.2	Continuity Equation for an Incompressible Fluid	198
6.2.3	Continuity Equation for a Compressible Fluid	200
6.3	Mass Conservation in a Consolidating Medium	202
6.3.1	Vertical Compressibility Only.	203
6.3.2	Extension to Three Phases and to Three-Dimensional Consolidation	208
6.3.3	Barometric Efficiency of Aquifers	211
6.4	Continuity Equations for Flow in Confined and Leaky Aquifers	213
6.4.1	The Horizontal Flow Approximation	213
6.4.2	Flow in a Confined Aquifer.	214
6.4.3	Flow in a Leaky Aquifer	216
6.4.4	Averaging the Exact Equations over a Vertical Line	218
6.4.5	The Boltzmann Transformation.	221
6.5	Stream Functions	222
6.5.1	Pathlines, Streamlines, Streaklines and Fronts	223
6.5.2	The Stream Function in Two-Dimensional Flow	225
6.5.3	The Stream Functions in Three-Dimensional Flow	226
6.5.4	The Partial Differential Equations for the Lagrange and Stokes Stream Functions	230
6.5.5	The Relationships between the Potential and the Stream Functions	233
6.5.6	Solving Problems in the ϕ - ψ Plane	235
6.6	Flow Nets and Ground Water Contour Maps	236
6.6.1	The ϕ - ψ Flow Net	236
6.6.2	The Ground Water Contour Map	239
6.7	The Partial Differential Equations Describing Flow of an Inhomogeneous Incompressible Fluid in Terms of Ψ	241
6.7.1	Two-Dimensional Flow	241
6.7.2	Axisymmetric Flow	243

CHAPTER 7

	Solving Boundary and Initial Value Problems	247
7.1	Initial and Boundary Conditions	248

7.1.1	Boundary of Prescribed Potential	250
7.1.2	Boundary of Prescribed Flux	251
7.1.3	The Steady Free (or Phreatic) Surface without Accretion	252
7.1.4	The Unsteady Free (or Phreatic) Surface without Accretion	254
7.1.5	The Steady Free (or Phreatic) Surface with Accretion	256
7.1.6	The Unsteady Free (or Phreatic) Surface with Accretion	258
7.1.7	Boundary of Saturated Zone (or of Capillary Fringe)	259
7.1.8	The Seepage Face	260
7.1.9	Capillary Exposed Faces	262
7.1.10	Discontinuity in Permeability	263
7.1.11	A Note on Anisotropic Media	269
7.1.12	Boundary Conditions in Terms of Pressure or Density	270
7.2	A Well Posed Problem	270
7.3	Description of Boundaries in the Hodograph Plane	272
7.3.1	The Hodograph Plane	272
7.3.2	Boundaries in the Hodograph Plane	274
7.3.3	Examples of Hodograph Representation of Boundaries	280
7.3.4	Intersection of Boundaries of Different Types	284
7.4	The Relations between Solutions of Flow Problems in Isotropic and Anisotropic Media	289
7.4.1	The Flow Equations	290
7.4.2	Relationships among Parameters in the Two Systems	291
7.4.3	Examples	296
7.5	Superposition and Duhamel's Principles	297
7.5.1	Superposition	297
7.5.2	Unsteady Flow with Boundary Conditions Independent of Time	299
7.5.3	Unsteady Flow with Time-Dependent Boundary Conditions	300
7.6	Direct Integration in One-Dimensional Problems	301
7.6.1	Solution of the One-Dimensional Continuity Equation	301
7.6.2	Advance of a Wetting Front	303
7.7	The Method of Images	304
7.7.1	Principles	304
7.7.2	Examples	306
7.8	Methods Based on the Theory of Functions	312
7.8.1	Complex Variables and Analytic Functions	313
7.8.2	The Complex Potential and the Complex Specific Discharge	316
7.8.3	Sources and Sinks	316
7.8.4	Conformal Mapping	324
7.8.5	The Schwarz-Christoffel Transformation	333
7.8.6	Fictitious Flow in the $\tilde{\omega}$ -Plane	337
7.9	Numerical Methods	338
7.9.1	Method of Finite Differences	338
7.9.2	The Method of Finite Elements	346
7.9.3	Relaxation Methods	348

7.9.4 Schmidt's Graphic Method	350
7.10 Flow Nets by Graphic Methods	351

CHAPTER 8

Unconfined Flow and the Dupuit Approximation	361
8.1 The Dupuit Approximation	361
8.1.1 The Dupuit Assumptions	361
8.1.2 Examples of Application to Hydraulic Steady Flows in Homogeneous Media	366
8.1.3 Unconfined Flow in an Aquifer with Horizontal Stratification	369
8.1.4 Unconfined Flow in an Aquifer with Vertical Strata	372
8.1.5 Unconfined Flow in a Two-Dimensional Inhomogeneous Medium	373
8.2 Continuity Equations Based on the Dupuit Approximation	374
8.2.1 The Continuity Equation	374
8.2.2 Boundary and Initial Conditions	378
8.2.3 Some Solutions of Forchheimer's Equation	379
8.2.4 Some Solutions of Boussinesq's Equation	381
8.3 The Hodograph Method.	388
8.3.1 The Functions ω and $\bar{\omega}$	388
8.3.2 The Hodograph Method	389
8.3.3 Examples without a Seepage Face	391
8.3.4 Hamel's Mapping Function	398
8.3.5 Zhukovski's and Other Mapping Functions	403
8.3.6 A Graphic Solution of the Hodograph Plane	406
8.4 Linearization Techniques and Solutions	408
8.4.1 First Method of Linearization of the Boussinesq Equation	408
8.4.2 The Second Method of Linearization of the Boussinesq Equation	417
8.4.3 The Third Method of Linearization of the Boussinesq Equation	419
8.4.4 The Method of Successive Steady States	420
8.4.5 The Method of Small Perturbations	422
8.4.6 The Shallow Flow Approximation	430

CHAPTER 9

Flow of Immiscible Fluids	439
9.1 Introduction	439
9.1.1 Types of Two-Fluid Flows	439
9.1.2 The Abrupt Interface Approximation	439
9.1.3 Occurrence.	440
9.2 Interfacial Tension and Capillary Pressure.	441
9.2.1 Saturation and Fluid Content	441
9.2.2 Interfacial Tension and Wettability	441
9.2.3 Capillary Pressure.	444
9.2.4 Drainage and Imbibition	449

9.2.5	Saturation Discontinuity at a Medium Discontinuity	452
9.2.6	Laboratory Measurement of Capillary Pressure	453
9.3	Simultaneous Flow of Two Immiscible Fluids	457
9.3.1	The Basic Motion Equations	457
9.3.2	Relative Permeability	459
9.3.3	Mass Conservation in Multiphase Flow	466
9.3.4	Statement of the Multiphase Flow Problem	466
9.3.5	The Buckley-Leverett Equations	468
9.3.6	Simultaneous Flow of a Liquid and a Gas	472
9.3.7	Laboratory Determination of Relative Permeability	473
9.4	Unsaturated Flow	474
9.4.1	Capillary Pressure and Retention Curve	475
9.4.2	The Capillary Fringe	480
9.4.3	Field Capacity and Specific Yield	483
9.4.4	The Motion Equation	487
9.4.5	Relative Permeability of Unsaturated Soils	491
9.4.6	The Continuity Equation	495
9.4.7	Methods of Solution and Examples	503
9.4.8	Additional Comments on Infiltration and Redistribution of Moisture	513
9.4.9	Comments on Vapor Movement in Unsaturated Flow	515
9.5	Immiscible Displacement with an Abrupt Interface	519
9.5.1	The Abrupt Interface Approximation	519
9.5.2	Piezometric Heads and Dynamic Equilibrium Conditions at a Stationary Interface	521
9.5.3	The Boundary Conditions along an Interface	524
9.5.4	Horizontal Interface Displacement	526
9.5.5	Interface Displacement in the Vertical Plane	533
9.5.6	Numerical and Graphic Methods	536
9.5.7	Approximate Solutions based on Linearization	538
9.5.8	Interface Stability	544
9.6	Determining the Steady Interface by the Hodograph Method	547
9.6.1	Boundary Conditions	548
9.6.2	Description of Boundaries in the Hodograph Plane	549
9.6.3	Examples	549
9.7	The Interface in a Coastal Aquifer	557
9.7.1	Occurrence	557
9.7.2	The Ghyben-Herzberg Approximation	559
9.7.3	Determining the Shape of a Stationary Interface by the Dupuit- Ghyben-Herzberg Approximation	561
9.7.4	Approximate Solution for the Moving Interface	563
9.7.5	Interface Upconing	569
9.7.6	The Dupuit-Ghyben-Herzberg Approximation for an Unsteady Interface in a Thick Aquifer	573

CHAPTER 10

Hydrodynamic Dispersion	579
10.1 Definition of Hydrodynamic Dispersion	579
10.2 Occurrence of Dispersion Phenomena	582
10.3 Review of Some Hydrodynamic Dispersion Theories	582
10.3.1 Capillary Tube and Cell Models	583
10.3.2 Statistical Models	587
10.3.3 Spatial Averaging	603
10.4 Parameters of Dispersion	605
10.4.1 The Coefficients of Mechanical Dispersion and Hydrodynamic Dispersion	605
10.4.2 The Medium's Dispersivity	611
10.4.3 Dispersivity-Permeability Relationship	615
10.5 The Governing Equations and Boundary Conditions	617
10.5.1 The Partial Differential Equation in Cartesian Coordinates	617
10.5.2 The Partial Differential Equation in Curvilinear Coordinates	619
10.5.3 Initial and Boundary Conditions	622
10.5.4 Solving the Boundary Value Problems	624
10.5.5 The Use of Nondimensional Variables	626
10.6 Some Solved Problems	626
10.6.1 One-dimensional Flow	627
10.6.2 Uniform Flow in a Plane	633
10.6.3 Plane Radial Flow	634
10.7 Heat and Mass Transfer	641
10.7.1 Modes of Heat Transfer in a Porous Medium	641
10.7.2 Formulation of the Problem of Heat and Mass Transfer in a Fluid Continuum	643
10.7.3 Formulation of the Problem of Heat and Mass Transfer in a Porous Medium	644
10.7.4 Comments on Some Heat and Mass Transfer Coefficients	647
10.7.5 Simplifying the Macroscopic Heat and Mass Transfer Equations	651
10.7.6 Convective Currents and Instability	653
10.7.7 Some Similitude Considerations	660

CHAPTER 11

Models and Analogs	665
11.1 General	665
11.2 Scaling Principles and Procedure	668
11.2.1 The Two Systems	668
11.2.2 Geometric Similarity	669
11.2.3 Kinematic Similarity	670
11.2.4 Dynamic Similarity	670
11.2.5 Dimensional Analysis	671

11.2.6	Inspectional Analysis	673
11.2.7	Modified Inspectional Analysis	676
11.3	The Sand Box Model	678
11.3.1	Description	678
11.3.2	Scales	680
11.4	The Viscous Flow Analogs	687
11.4.1	General	687
11.4.2	Description of the Vertical Hele-Shaw Analog	687
11.4.3	Establishing the Analogy between Analog and Prototype	690
11.4.4	Scales for the Vertical Analog	693
11.4.5	Recommended Applications of Vertical Analog	696
11.4.6	The Liquids	697
11.4.7	The Horizontal Hele-Shaw Analog—Description and Scales	697
11.4.8	Simulation of an Infinite Horizontal Aquifer	701
11.5	Electric Analogs	702
11.5.1	Description of the Electrolytic Tank and the Conducting Paper Analogs	702
11.5.2	Scales for the Electrolytic Tank Analog	708
11.5.3	The Resistance Network Analog for Steady Flow	710
11.5.4	The Resistance-Capacitance Network for Unsteady Flow	716
11.5.5	The Ion Motion Analog	719
11.6	The Membrane Analog	722
11.7	Summary	725
	Answers to Exercises	729
	Bibliography	733
	Index	757
