Preface

type-157
13/2

This book is concerned with the applications of computers in geography. It is not a computer manual; indeed it is not a computer book as such. It is a geography book which considers how geographers from all branches of the discipline can enhance their work by using computers. Little knowledge of computers and quantitative techniques is assumed at the outset. The necessary key concepts and techniques are introduced at the appropriate place within the text.

This book follows a logical progression. It begins with an introductory chapter that overviews the subject of computers in geography. The following chapters consider how computers can be used in each of the major stages on the road to geographical explanation. Thus there are chapters on data collection, storage, management, analysis and presentation. Each chapter has suggestions for further reading and there is a comprehensive bibliography at the end of the book. Technical phrases used in the text are explained in a glossary also at the end of the book. Examples are used throughout to demonstrate how best to apply information technology to specific problems in both human and physical geography. The examples are illustrated by over 100 photographs, line drawings and tables.

The general discussion is relevant to mainframe computers, mini-computers and microcomputers alike. Special emphasis is, however, given to microcomputers, reflecting the enormous contribution they have made to geographical computing in the 1980s. Many of the examples are based around Acorn and IBM hardware and software products which are in widespread use in educational establishments in several

countries, notably in Britain and North America. Whilst these examples have been designed to illustrate general principles, inevitably it has been necessary to present some specific hardware and software details. It should be borne in mind when reading the examples that many other combinations of hardware and software can be used to achieve similar results.

This book is aimed primarily at first- and second-year undergraduates, though much of the material will be relevant to other students and lecturers. Undergraduates will find that it offers an overview of current and potential future applications of computers in geography. It also presents details of the impact of information technology on science and society. Lecturers should be able to use it to find ways of using computers to enhance their teaching, research and administration. Those lecturers concerned with departmental resource allocation should, in addition, find the reviews of hardware and software and the discussion about the role of computers of value.

Two frequent criticisms of books that discuss computers are that they are often out of date before they are published and that they contain too much crystal-ball gazing. To try to avoid the first criticism I have liaised closely with the publishers to minimize delays. To try to avoid the second I have restricted discussion of the latest or shortly-to-arrive hardware and software, which some cynical computer users refer to as 'vapourware', because they often never arrive or live up to their advanced publicity. I have aimed slightly on the conservative side and have chosen to discuss only those aspects of computing in geography that have been proven at the time of writing.

Last, but by no means least, I would like to thank and dedicate this book to Heather, Amy and Walt, without whom this book would not have been possible or worthwhile. One of them read, commented on and corrected everything; the others slept through most of the process.

Chapter 1 Computers in Geography	1
The quantitative and computer revolutions in geography	3
The applications of computers in geography	5
Computerizing Domesday Book	5
Statistical analysis of shopping survey data by computer	6
Computer modelling of hillslope hydrology	8
Computer Assisted Learning (CAL)	10
Developing computer applications in geography	11
Conclusion	13
Chapter 2 Geographical data collection	15
Geographical data	16
Data loggers	17
Using an automatic data logger for weather station monitoring	19
Using a semiautomatic balance data logger	21
Data entry	23
Specialist data entry devices	23

	Keyboard data entry	23
	Using a soil profile recorder for data entry	25
	Conclusion	29
Chapter 3	Geographical data management	30
	Data base concepts and structures	30
	Data base management systems	36
	Creating a data base	36
	Extracting data from a data base	37
	Transferring data between software packages	39
	Data protection	39
	ViewStore	40
	dBASE	41
	Creating and using a data base of census data	42
	Conclusion	46
Chapter 4	Statistical analysis	48
	Subprograms/subroutines	50
	Single programs	51
	Packages	53
	Spreadsheets	54
	Creating a spreadsheet to analyse examination data	56
	Specific purpose statistical analysis packages	57
	SNAP	58
	General purpose statistical analysis packages	58
	The analysis of geographical data using Minitab	60
	Conclusion	63
Chapter 5	Computer cartography 绘制地图	65
	The principles of computer cartography	66
	Vector and raster graphics	66
	Resolution	68
	Computer cartography hardware	68
	Digitizer	69
	Joystick	70
	Light pen	71
	Plotter	71
	Camera	72
	Computer cartography software	72
	The benefits of computer cartography	78
	The applications of computer cartography	79
	Topographic and thematic mapping	79
	Capturing digital map data	79

	The uses of digital map data	81
	Statistical graphics	83
	Mapping population census data using GIMMS	85
	Conclusion	89
Chapter 6	Remote sensing and image analysis	91
	The principles of remote sensing	92
	Data collection	94
	Aerial photographs	95
	Satellite images	96
	Image analysis hardware and software	99
	Image analysis operations	103
	Pre-processing	103
	Enhancement	103
	Image classification	104
	Image interpretation	105
	The applications of remote sensing and image analysis	105
	The use of remote sensing for mapping wetlands	107
	Conclusion	109
Chapter 7	Simulation	111
	The nature of geographical simulation	112
	The model-building process	113
	The value of computer simulation models	114
	The applications of computer simulation models	115
	A deterministic simulation of nutrient cycling	116
	A probabilistic simulation of factory location	119
	A deterministic/probabilistic simulation of urban structure	123
	A deterministic gaming simulation of coastal oil pollution	124
	Conclusion	130
Chapter 8	Word processing	132
	The benefits of word processing	133
	Word processing hardware	134
	Printers	135
	Word processing software	140
	Editing	140
	Formatting	141
	Printing	142
	Macros	143
	Accessories	144

	Creating and editing a document using WordStar	145
	Desk Top Publishing	146
	Conclusion	147
Chapter 9	Communication	149
	The principles of digital communication	150
	Analogue to digital conversion	150
	Transmission patterns	151
	RS232-C interface	153
	Handshaking	155
	Error parity	155
	Transmission speeds: baud rate	155
	Software control	156
	Communicating with other computers	156
	Direct lines	157
	Local and wide area networks	157
	The Econet local area network	159
	The JANET wide area network	161
	Telephone links	162
	Videotex	165
	Extracting information from the Prestel on-line data base	166
	Conclusion	169
Chapter 10	Geographical information systems	171
	The benefits of GISs	172
	The development of GISs	173
	The fundamental components of GISs	174
	The functions of GISs	175
	Data input	176
	Storage	176
	Manipulation	177
	Output	182
	The applications of GISs	182
	Planning and managing public services using GISs	182
	Using GISs in natural resource management	185
	Creating an environmental data base for the European Community	186
	The BBC interactive videodisk data archive	189
	Conclusion	192
Chapter 11	Computer hardware	194
	The structure of computers	195
	The development of computers	196

	Mainframe computer, minicomputer and microcomputer	199
	The elements of a computer	199
