# Dedication

To my wonderful family—my wife Terry and daughters Donna and Barbara—for their encouragement and support throughout my professional career, and particularly for their remarkable tolerance and understanding in the writing of this book.

# Preface

What should every citizen know about computers and computer technology? For better or worse, answers typically depend upon who is asked.

- Students commonly have a practical bent: How can one get the computer to perform specific tasks, why does a machine act the way it does, what is involved in getting computers to interact, and so on.
- Computing faculty typically emphasize the need to understand concepts and problem solving.
- The National Research Council (NRC) identifies appropriate general knowledge and skill as computer fluency, and summarizes its perspective in a 1999 report, *Being Fluent with Information Technology*.

On the surface, such perspectives may seem unrelated or contradictory. The practical details of interest to students may seem quite different from the high-level concepts and abstractions highlighted by faculty. Some textbooks written by faculty may do a fine job in covering foundational material, but often omit the practical issues that motivate students. Other books may describe pragmatic elements about how to run specific software (e.g., how one can utilize a bold type font in a word processing document), thus satisfying some students, but such books rarely provide adequate coverage of more general and lasting concepts.

## Practical Questions with Thoughtful Answers

This book takes a different approach. The starting point is the observation that thoughtful answers to common, practical questions often require an understanding of ideas and principles. Simple, narrow, superficial answers can avoid deep issues, but these are rarely satisfying over the long run. Students want serious answers to their genuine questions, and such responses require the material that faculty wish to cover and the NRC has identified.

## Question-Based

The second principle motivating this book is that students learn best when material connects with their experiences, backgrounds, and perspectives. To capture student interest, this book is organized around questions typically asked by general computer users. Common general questions provide the title and theme for each chapter, while more detailed questions provide a focus for each section within a chapter.

The style reflects the circumstances of a conversation. The reader has many questions about computing and information technology, and the book seeks to provide answers. Throughout, the starting place for discussion is a question—often a real question heard from a computer user or raised by actual students in class.

## Computer Fluency

A third principle behind this book concerns the need to cover adequate material to allow readers to function effectively in today's computer-based society. Such background sometimes is described as *computer fluency*. More precisely, in 1999 a study group of the NRC produced the report *Being Fluent with Information Technology*, which addresses what every informed citizen should know about computers and technology. The report identifies ten high-level “intellectual capacities,” ten “information technology concepts,” and ten practical “information technology skills” that cover basic computer fluency.

Planning this book included a regular review of these areas, so that all fluency topics are addressed. The Appendix presents more detail of this coverage, with a table that maps fluency topics to chapters.

Of course, in some cases, faculty may wish to supplement this material with lab-based experiments and experiences. In such cases, this book provides appropriate background for the lecture/discussion component of a course, while a lab might use specific hardware/software manuals and exercises.

## This Book as *The Tao of Computing*

“Tao” is a Chinese word meaning “the way,” and many references to “Tao” are related to the ancient spiritual text *Tao Teh Ching*, or the *Way of Life*, according to Lao Tzu. *Tao Teh Ching*

presents a humble, simple, clear, and elegant philosophy of life and behavior. The text consists of 81 short passages, many in blank verse; each passage provides insight for some component(s) of human living.

*The Tao of Computing*, of course, focuses on computer systems rather than spiritual philosophy. Within this focus, the book presents a clear and direct explanation of computer systems through a series of separate, but coordinated, answers to diverse questions.

Overall, this book seeks to unlock the mysteries of computers and provide a basis for further study and reflection, just as the *Tao Teh Ching* explains a path for the way of life.

## **Content Organization**

Although practical questions of computer users may seem simple, these answers often draw upon important elements of computer design, software development and use, network connectivity, elements of the Internet, human–computer interactions, and applications. For efficiency in presentation, therefore, chapters are grouped into parts by broad subject (low-level issues, software design and problem solving, elements of networking, Web issues, and social and ethical matters). Within a part or chapter, material flows so that answers from early questions provide relevant background for later questions.

## **Terminology**

One objective fact of life within computing is the use of technology to express ideas concisely. For example, computer terminology arises frequently in discussions of hardware and software, claims about new products and features, and projections for the future. Although general users need not know many of the more technical terms, they do need some basic vocabulary to understand what is said, and they need basic concepts and ideas to be able to evaluate claims (such as, is a new approach or product really revolutionary, or just a minor refinement?).

To establish this foundation, this book presents about a dozen basic terms in each chapter—not as isolated words, but as part of the natural flow of ideas. This inclusion of terminology complements the

discussion of ideas and principles. At the end, readers should understand the important concepts and the words that support those ideas.

## Other Pedagogical Features

Each chapter contains several additional features to promote learning and discussion:

- A summary at the end of each chapter highlights main concepts and ideas.
- Discussion questions raise ideas to promote productive group conversations. Some questions explore ideas presented within the chapter, others develop related ideas, and still others require personal reflection or research.
- Exercises reinforce topics within each chapter, emphasizing personal understanding and the application of ideas.

Credits to be specified in the Preface

## Figures in this Book

Color versions of many pictures in this book are available on the World Wide Web at <http://www.cs.grinnell.edu/~walker/fluency-book/>. Some laboratory exercises also are available at this site.

## Credits

Several passages in this book are edited versions of sections of *The Limits of Computing*, written by this author and published by Jones and Bartlett in 1994. Part of Chapter 11 is a revised version of material from *Abstract Data Types: Specifications, Implementations, and Applications* by Nell Dale and this author, published by Jones and Bartlett in 1996.

The author gratefully acknowledges the permissions received from individuals and publishers for the following figures and passages.

### Chapter 1

Figure 1.4 comes from Figure 1: B. Burgess et al., “The PowerPC 603 Microprocessor,” *Communications of the ACM*, V. 37:5, June, 1994. p. 35. (c) 2002 ACM, Inc. Reprinted by permission.

Figure 1.5a was taken for this book by Ed Dudak, Physics Technical Assistant at Grinnell College.

## Chapter 2

Figure 2.1 was developed for this book by Fredrick C. Hagemester, Curricular Technology Specialist for the Sciences at Grinnell College.

Figures 2.4 through 2.8 are pictures in the public domain. Figure 2.4 was taken by C. Clark, NOAA Photo Library, NOAA Central Library; OAR/ERL/National Severe Storms Laboratory (NSSL). Figures 2.5 and 2.8 were photographed by John and Karen Hollingsworth, U.S. Fish and Wildlife Service. Figure 2.6 was taken by Joseph O'Brien, plant pathologist, Forest Health Protection Unit, U.S. Forest Service. Figure 2.7 is the Food Guide Pyramid from the U. S. Department of Agriculture (USDA) and the U. S. Department of Health and Human Services (DHHS).

## Chapter 7

“A Dead Fish” is taken from Dennie and Cynthia L. Van Tassel, *The Compleat Computer, Second Edition*, Science Research Associates, Inc., 1983, p. 22. Reprinted by permission of the authors.

“Piano Sale” is also taken from Dennie and Cynthia L. Van Tassel, *The Compleat Computer, Second Edition*, Science Research Associates, Inc., 1983, p. 233. Reprinted by permission of the authors.

## Chapter 13

Figure 13.3 reflects a view of a Grinnell College Mail Services page. This image appears courtesy of Grinnell College.

The picture of the first multimedia message in sidebar figure 1 is a personal photograph of Nathaniel Borenstein who has its distribution rights. The picture appears with his permission.

## Chapter 15

Material from Kevin Engel's *The Strategic Guide to Quality Information in Biology, Chemistry, Computer Science, Medicine, Physics, and Psychology* appears with the author's permission.

# Acknowledgments

Some questions used here derive from the author's conversations and correspondence with members of the Special Interest Group in Computer Science Education (SIGCSE), of the Association for Computing Machinery (ACM). Over the years, the author has benefited greatly from his association with that organization and with the many conversations he has had with its members.

The author is grateful for the encouragement and professional assistance provided by Jones and Bartlett Publishers, particularly that of former Editor-in-Chief Michael Stranz, Editorial Assistant Caroline Senay, and Production Manager Amy Rose. Special thanks to Theresa DiDonato, who provided wonderful feedback on the first full draft of this manuscript. The finished book is substantially improved by her insights and suggestions.

Many thanks to Fred Hagemester, Instructional Technology Specialist at Grinnell College, for his technical review and suggestions regarding graphical formats and image representations. Thanks also to Todd Coleman, another Instructional Technology Specialist at Grinnell, for his help in developing images for examples on the same material. Similarly, Dan Keller was most helpful in gathering cables and preparing equipment for the author's pictures of various pieces of hardware.

Special thanks also to the Academic Support Assistants for the Science Division at Grinnell College who have helped with many components of manuscript preparation. Mary Heitsman deserves particular credit for her efforts in typing and preparing the book's index; Stephanie Peterson helped with questions and mechanics related to image processing; and Karen Thomson has contributed to many aspects of documentation preparation for many years. Additional thanks to Ed Dudak, Physics Technical Assistant, for his help in producing Figure 1.5a.

The author greatly appreciates the support of Grinnell College throughout this project, particularly its Senior Leave program. Special thanks to Grinnell's Committee for the Support of Faculty Scholarship and Dean James Swartz for their naming the author as Frank and Roberta Furbush Faculty Scholar in Mathematics and Computer Science for 2002–2003. Such scholar programs come

about through the progressive thinking of interested contributors, and the author is particularly grateful to the Furbush family for the establishment and support of this grant program.

Finally, the author thanks his wife Terry and daughters, Donna and Barbara, for their encouragement and support throughout his professional career. Book development requires a focus. In writing, the world can seem wonderful when directions are clear and words flow, but an author can be grumpy and worse when progress seems slow. Terry, Donna, and Barbara demonstrate remarkable tolerance, understanding, and support throughout all these times; this book is dedicated to them.

# Table of Contents

## Part I Low-level Questions

<b>Chapter 1 How are computers organized?</b>	<b>1</b>
What is meant by “computer programs,” “software,” “data,” “computer applications,” and “processing,” and how do they differ?	2
How do computers work?	4
What are the main components inside a machine?	5
How are components connected within a computer?	8
With so few main components, what do the other hardware elements do?	11
What does the “brain” of a computer look like?	14
How does this description of components relate to what I can actually see within a computer?	18
What is a “virtual machine”?	21
Summary	22
Terminology from This Chapter	23
Discussion Questions	23
Exercises	25
<b>Chapter 2 How are data represented (and who cares)?</b>	<b>27</b>
Why should I care about the way data are represented inside computers?	28
Why do computers work in binary?	29
Why should I care about the way data are represented inside computers?	31
Can a finite computer store real numbers with infinitely many decimal places?	37

Can storage of data affect the accuracy of results?	38
How does a computer know to use a Roman alphabet for English, but other alphabets for Russian, Greek, or other languages?	39
How are images created on a computer monitor or on paper with a printer?	44
What are some of the approaches used to store images in a reasonably compressed way?	46
I have encountered “.gif,” “.ps,” and “.jpg” image files when surfing the Web. How do these image files work?	50
Do these differences among various file formats really matter?	51
What are the tradeoffs in handling pictures and other graphical applications?	52
Summary	57
Terminology from This Chapter	58
Discussion Questions	58
Exercises	60
<b>Chapter 3 Where are programs and data stored?</b>	<b>65</b>
What kinds of memory are there?	65
When do data move from one type of memory to another?	75
How much memory is enough?	77
What is the difference between deleting a file and erasing it?	80
What does it mean to “defragment” a disk, and should I care?	81
What is a computer virus, and how does one work?	82
How can a virus be detected?	84
How can I protect myself against computer viruses?	85
Summary	85
Terminology from This Chapter	86
Discussion Questions	87
Exercises	89

<b>Chapter 4 What is an operating system and what does it do?</b>	<b>93</b>
What is an “operating system”?	93
Why are there different operating systems?	96
What is “multitasking,” and does this idea affect me?	97
Why do operating systems worry about coordinating different programs or users? Can’t they just work separately?	99
What do you mean by “booting” the computer?	102
What is a “reboot,” and why might it be necessary?	103
Why do so many people and companies use Windows?	104
Why can’t a Windows machine read a Macintosh or Linux disk, but many Macintosh and Linux machines can read a Windows disk?	105
Which operating system is best?	107
Why does my diskette work at home but not in the computer lab at school, or work?	107
Summary	109
Terminology from This Chapter	110
Discussion Questions	110
Exercises	112
<b>Part II Software/Problem-Solving Questions</b>	
<b>Chapter 5 How are software packages developed?</b>	<b>115</b>
What are the main steps in software project development?	115
How do developers decide what capabilities to put in their software?	121
How are the users’ needs determined?	121
If development is user-driven, why are there features I don’t use or even want?	125
Why are software packages and operating systems changed or updated so often?	126

But why should software change at all?	127
Why does most software contain errors (bugs)?	129
What kinds of coding mistakes pass through testing?	129
If the code for individual parts of the program is correct, what can go wrong?	130
What if all the interacting components of a program are error-free? What else can cause errors?	131
What is a programmer? Do they work in isolation?	132
How do I know if it is wise to upgrade my software? Sometimes it seems to be helpful; sometimes things get worse.	133
Summary	135
Terminology from This Chapter	136
Discussion Questions	136
Exercises	138
<b>Chapter 6 What should I know about the sizes and speeds of computers?</b>	<b>141</b>
How fast does technology really evolve?	142
What made Paul's Option 2 payments so huge?	145
How does this fable relate to computers?	147
When do solutions scale up?	148
How does complexity affect problem solving?	155
What are some difficulties logical complexity causes in computers?	157
When does the cost of "more" outweigh the benefits?	159
Summary	166
Terminology from This Chapter	166
Discussion Questions	166
Exercises	168
<b>Chapter 7 What can computers do for me?</b>	<b>171</b>
What types of problems are computers good at?	172
When would a computer's storage and retrieval skills help me?	172

How do a computer's computational capabilities help me?	174
What else can computers help me with?	177
What do good applications have in common?	177
Why can a computer guide astronauts into space but not predict the stock market?	179
If computers that predict the stock market are unreliable, how I can tell when other computer programs might be giving unreliable results?	181
For problems that a computer can solve, what process should I use to get an answer?	183
Can some computers solve problems that other computers can't solve?	186
What are Turing Machines?	187
So, what do Turing Machines have to do with computers today?	192
If all computers are universal, how do they differ?	193
How can I decide what machine I should buy?	195
Summary	197
Terminology from This Chapter	198
Discussion Questions	198
Exercises	201

### **Part III Networking/Distributed System Questions**

<b>Chapter 8 How are computers connected?</b>	<b>205</b>
How do you physically connect computers?	205
Could you expand on the use of the eight RJ-45 wires?	213
Are point-to-connections used for networks or only for connecting two computers?	215
How are computer networks usually connected?	215
Can start networks and Ethernet networks connect an arbitrarily large number of computers?	223
How does wireless technology work?	227

If all of the wireless computers in an area are mobile and do not have Internet access, can they still connect?	234
Summary	234
Terminology from This Chapter	236
Discussion Questions	236
Exercises	238
<b>Chapter 9 How do users share computer files?</b>	<b>241</b>
What are file servers and how do they work?	242
How do people access and use files on the network?	245
How are files shared?	250
Why can some machines (e.g., using Windows, Macintosh, Linux) access some files, but not others?	253
When someone wants a file from a server, how does the server know whether to use FTP, remote access, or other programs?	256
What makes TCP/IP work?	257
Summary	260
Terminology from This Chapter	261
Discussion Questions	261
Exercises	263
<b>Chapter 10 When can I consider my personal data secure?</b>	<b>265</b>
How can I be sure my files will be available when I need them?	267
How reliable and secure are ATMs?	269
How well do password systems work?	272
Besides password systems, what else can I do to protect my files?	273
What internal security threats do computers encounter?	278
What external (networking) threats do computers encounter?	280
What do firewalls do, and how do they work?	286
