Hofmann  
Rubber Technology Handbook

## Preface

The rubber industry, though ranking among the “old established” industries, which are generally held to be conservative, has shown a markedly progressive development over the last decades. Developments in the field of synthetic elastomers have progressed so rapidly that the whole concept of rubber technology has changed. In other fields, rubber technology has expanded greatly.

Although numerous monographs have been written about partial aspects of rubber technology, I know of no modern textbook that treats all fields equally. 25 or more years have passed since the publication of earlier textbooks. A variety of new rubber types, rubber chemicals, processing technologies, analytical techniques and test methods have been developed or improved on since then. Many old concepts have had to be modified in the face of new discoveries, or even completely abandoned and replaced with new ones. The previous exact definitions of rubber and elastomer terminology have become progressively more ambiguous since the boundaries between elastomers and thermoplastics and between elastomers and thermoset materials have broken down. New structural modifications have enabled rubbers to penetrate into previously inconceivable border areas.

The time therefore seems to have come to collect the experience in the field of rubber technology. Two procedures are in principle possible for this, each with its advantages and disadvantages. One is for the author to act essentially as editor, co-ordinating the sections written individually by experts. This method has the advantages of depth of information and topicality, but the disadvantages of uneven structuring, overlap, repetition, etc. The other possibility is for a single author to conceive the entire work himself. This has the advantage that the structure is a unified whole, all individual aspects are interlinked by cross-references, and a uniform bibliography can be drawn up; the disadvantage of this method is that no author can have specialist knowledge in all fields equal to that of the sum of the experts. Despite this disadvantage, I have chosen the second method. To overcome the stated disadvantage of a non-uniform depth of information across the different areas, I have laid special importance on comprehensive bibliographies.

In addition to complete descriptions, these bibliographies, extending to over 2500 literature references, provide, monographs, current publications, lecture topics and important patents. As far as is necessary and feasible, each major bibliographic section has been subdivided into literature that provides a general survey and the special literature that is quoted in the text. The main importance of the bibliographies for the reader should be the possibility of quick reference to more advanced literature for practically any topic of rubber technology. I have therefore paid particular attention to preparing them. During the two years of compiling this book, I have included the most important new literature sources in the already indexed bibliography, so that the literature is largely up to date as far as 1987/88.

This method allowed me, and this was my first priority, to describe all the partial aspects of rubber technology concisely and with a uniform subdivision. This made it possible to deal with and present all areas in one handy volume. The publication of this English-language international edition was encouraged by a positive review of an earlier German-language edition in *Rubber Chem. Technol.* **55** (1982), whose last sentence read “An English-language version would be of great value”.

The book is subdivided into the following sections: Definition (9 pages); Natural rubber (25 pages), which because of its special means of manufacture and importance is treated separately; the large chapter “Synthetic Rubber” (179 pages), which

is subdivided into over 20 sections describing the individual rubber classes, and includes the section on thermoplastic elastomers, which in turn includes numerous sections for all important classes of materials; the large chapter "Rubber Chemicals and Additives" (136 pages), also with numerous subsections for all important classes of materials; the chapter on processing technology (113 pages) and on testing and analysis (37 pages), which each describe all the essential problems and techniques in a brief space. To increase the value of the new book as a reference work I have compiled a trade marks index based on the documents accessible to me.

This work is founded on my postdoctoral thesis on "Rubber Technology" at the Technical University of Rheinland-Westphalia in Aachen, which was intended as duplicated lecture notes to help my students in approaching this field. My thanks to Bayer AG for the opportunity of preparing these manuscripts. Main emphasis in these manuscripts was placed on an understanding of the materials and a knowledge of the processing technology. Through my innumerable publications (books, book sections, papers in encyclopedias, and technical papers) on the most varied aspects of rubber technology over the 35 years of my professional life, and my cooperation with numerous companies in the supply industry and in rubber manufacturing, I have had to read so much technical literature and have collected so much information on the most varied specific fields, that it was time to prepare an all-embracing unified work from the previous manuscripts. In doing this I have attempted strict neutrality as regards companies.

A book of this kind cannot and does not try to be a substitute for personal experience; rather it should, on the one hand, be a textbook to help the emerging generation of rubber technologists obtain a rapid grasp of this material. On the other hand it should aid the experienced user as a reference book for various topics, and permit rapid access to the original literature. If it has succeeded in this, then the attempt to create a comprehensive description of rubber technology has been worthwhile.

I have received much help in conceiving this manuscript, for which I would like to use this opportunity to give my heartfelt thanks. The following persons helped me by conceiving, updating or correcting the individual sections: *Mr. Stagraczinski* (Weber und Schär, Hamburg), and *Dr. Klinkhammer* (D.O.G. Hamburg), in correcting and updating the chapter "Natural Rubber", *Mr. Hübsch* and *Mr. Heiling* (Du Pont, Bad Homburg), as well as other employees of this company for checking and supplementing various sections on elastomers that concerned Du Pont; *Mr. Grigat* (Cabot, Hanau) for checking and updating the chapter "Fillers"; *Dr. Graf* (Klöckner-Ferromatik-Desma, Achim) for updating and supplementing the chapter "Injection Molding", and the supply of graphic materials; *Mr. Cappelle*, (Berstorff, Hannover), *Mr. Koch* (Werner & Pfleiderer, Stuttgart), *Dr. Küttner* (Speyer) and *Dr. Targiel* (Troester, Hannover) for correcting parts of the manuscript on "Process Technology" and providing graphic material; *Dr. Seeberger* (Akzo Chemie, Düren), and *Mrs. Wülfken* (D.O.G., Hamburg) for correcting and supplementing the "Trade Marks Index". I thank *Dr. Bauer* (Dunlop, Mississauga, Canada) for his expert translation of Chapters 1-3 and *Prof. Dr. Meinecke* (University of Akron, USA) for his expert translation of Chapters 4-6; *Mrs. Gertrud Wülfken* (D.O.G. Hamburg) for her help with the proofreading, Clouth, Cologne, for the opportunity to use their library, D.O.G., Hamburg, for the realization of this work. Finally I thank my daughter *Regine* for her help in preparing the Trade Names Index, and, last but not least, my wife *Ruth* for her tireless patience with me during the drafting of this work.

# Buyer's Guide

Materials, equipment and services for the rubber and ancillary industries. All entries are paid for by and are the responsibility of the companies concerned. No claim is made as to the completeness of the index and the editor assumes no responsibility for omissions or errors.
