Preface to	the English edition	13
Introduct	ion	15
0.1	Objectives	15
0.2	Chapter 1	16
0.3	What is an expert system?	16
0.4	What is an expert	17
0.5	TWAICE	17
0.6	Chapter 2	18
0.7	Chapter 3	18
0.8	Chapter 4	18
0.9	Chapter 5	19
0.10	Chapter 6 — Learning	19
0.11	Chapter 7 and onwards	19
0.12	Guiding note	19
	views on the state of the art in artificial intelligence art E. Savory, Nixdorf Computer AG	
1.0 Ir	troduction	2
	short history	2
1.1.	1 The first decade: 1955 to 1965	22
1.1.	2 The second decade: 1965 to 1975	22
1.1.	3 The third decade: 1975 to to-day	23
	olving problems	24
1.3 N	atural language understanding	25
	peech processing	26
1.5 V	ision and robotics	27
	xpert systems	28
	epresentation of knowledge	31
	he future of artificial intelligence	33
2.0.	1 Pessimism	33
1.8.	2 Optimism	33
2 Exper	t systems for commercial use nelore Roesner, Nixdorf Computer AG	
	he problem	35
	rtificial intelligence and expert systems	37
	1 The broad domain of artificial intelligence	37

2.2.2 The market for artificial intelligence and expert systems	39
2.2.3 The first applications of expert systems	40
2.2.4 A typical example of an expert system at work with	
non-technical users or the European Vacation Hay Fever	
Expert System	40
2.3 Requirements for expert systems in industrial use	46
2.3.0 Introduction	46
2.3.1 Requirements of the application domain	46
2.3.2 The user interface	47
2.3.3 A comprehensive advisory capability	48
2.3.4 Knowledge engineering and the education of knowledge	
engineers	49
2.3.5 Embedding an expert system into the existing	
organisational structures	49
2.3.6 Requirement for the expert system to exhibit 'intelligence'	50
2.4 On technology transfer between academic research and	
industrial development	51
2.4.0 Introduction	51
2.4.1 Constraints of industrial development	52
2.4.2 Limitations of academic research	54
2.4.3 Shortcomings in research	56
2.4.4 The possibilities for technology transfer	58
2.5 Conclusions	59
3 Functionality and operational features of the expert system

Preface to the English edition

This book originally appeared in German, published by Oldenbourg Verlag, Munich, in 1985. The material dated from 1984. During 1986 it was revised and appeared as a second revised edition in 1986. Mike Rogers of the EEC produced this English translation in 1987, adding Appendices A and C. I then amended his translation to include some more up-to-date research work, and also updated the bibliography where possible. So the book you hold in your hand is current today. Biographical details of the (senior) authors of each paper have also been added as Appendix B.

Paderborn, FRG 7th November 1987 Stu Savory

Introduction

0.1 OBJECTIVES

The objective of this book is to give the reader an overall insight into a specific area of industrial research in Artificial Intelligence (AI): that of Expert Systems.

Artificial Intelligence is a key technology for the software of the future. AI concerns itself with the areas of application that involve human reasoning, in that it attempts to imitate reasoning and draw inferences. AI, it should be stated, is not a special methodology, but a framework of interwoven processes that are used together to achieve these goals.

The application areas that are included in the common definition of AI include, amongst others:

- knowledge based systems or expert systems
- intelligent/learning systems
- natural language translation/understanding
- automatic programming with correctness proven
- understanding/generation of speech
- image and scene analysis in real time.

The major part of the above list reflects priorities that are apparent in industrial research and development, especially as seen by one leading company, Nixdorf AG of the Federal Republic of Germany. Nixdorf have been committed to research and development of expert systems since 1982, with an ever increasing team.

The core of this book is made up from contributions of results from this team, or from complementary co-ordinated work in universities. The work is presented in such a way as to represent a complete, albeit brief, overview of the developments up to 1984/85. Subsequent looks by Dr Savory will decribe further progress made in 1985/86 and onwards.

The reader will be able to gain an insight into what can realistically be expected from a current state of the art in knowledge based systems in the sense of what it can and, more importantly perhaps, what it cannot do.

0.2 CHAPTER 1

This is a scene setting overview of the mature state of the art in AI in general, as well as a brief résumé of the historic stages in the main research areas over three decades. The seminal publications are referred to.

The objective of the chapter is to give the reader a feel for the type of application that may be supported by AI tools and methods. In order to make the subsequent sections more palatable, the reader needs to appreciate just what expert systems are and where they fit into the scheme of AI.

0.3 WHAT IS AN EXPERT SYSTEM?

Expert systems are a specific group of methods and tools as a subtopic in the wider area of artificial intelligence. What is AI, though? Almost every author has his own opinion and endless debate on this topic is commonplace.

Some of the more notable definitions are:

[R. Davis and D. B. Lenat] in Knowledge Based Systems in Artificial Intelligence (1982):

AI is the symbolic, non algorithmic reasoning process. Intelligence can be explained as a symbol manipulating activity, and that this can be realised on a physical symbol machine such as a digital computer.

This view is shared by Newell and Simon in a classic Turing Award lecture in 1976 [Newell and Simon].

[N. J. Nilsson] in Principles of Artificial Intelligence (1982) states that:

Human activities such as writing books, computer programs, commonsense reasoning, natural language understanding or driving a car are said to be demanding a level of "intelligence". Over the years, computer programs have been built that can perform tasks such as these. We might say that such systems possess some degree of artificial intelligence.

[E. Rich] in Artificial Intelligence states that:

AI is the study of how to make computers do things at which, at the moment, people are better. This ephemeral definition only betrays the current state of the art, not the objectives.

However, probably the widest accepted definition is that of Minsky [in Semantic Information Processing, 1982]:

AI is the science of making machines do things that would require intelligence if done by humans.

This is an attractive definition, since it avoids saying anything about "intelligence" of course.
