Preface

Welcome to NLDB 2004, the 9th International Conference on the Application of Natural Language to Information Systems, held at the University of Salford, UK during June 23–25, 2004. NLDB 2004 followed on the success of previous conferences held since 1995. Early conferences, then known as Application of Natural Language to Databases, hence the acronym NLDB, were used as a forum to discuss and disseminate research on the integration of natural language and databases and were mainly concerned with natural-language-based queries, database modelling and user interfaces that facilitate access to information. The conference has since moved to encompass all aspects of information systems and software engineering. Indeed, the use of natural language in systems modelling has greatly improved the development process and benefited both developers and users at all stages of the software development process.

The latest developments in the field of natural language and the emergence of new technologies has seen a shift towards storage of large semantic electronic dictionaries, their exploitation and the advent of what is now known as the Semantic Web. Information extraction and retrieval, document and content management, ontology development and management, and natural language conversational systems have become regular tracks in recent NLDB conferences.

NLDB 2004 saw a 50% increase in the number of submissions, and NLDB has established itself as one of the leading conferences in the area of applying natural language to information systems in its broader sense. The quality of the submissions and their diversity made the work of the members of the program committee more difficult than usual. Sixty-five papers were submitted from 22 different countries. Twenty-nine were accepted as regular papers, while 13 were accepted as short papers. The papers were classified as belonging to one of these themes:

- Natural language conversational systems
- Intelligent querying
- Linguistic aspects of modeling
- Information retrieval
- Natural language text understanding
- Knowledge bases
- Recognition of information in natural language description
- Natural language text understanding
- Knowledge management
- Content management

This year we were honored by the presence of our invited speaker Fabio Ciravegna from the University of Sheffield, UK. His lecture on “Challenges in Harvesting Information for the Semantic Web” was highly appreciated, and initiated vivid discussions.

We are very thankful for the opportunity to serve as Program Chair and Conference Chair for this conference. However, the organization of such an event is a collective effort and the result of a team’s work. First of all we would like to thank the

VI Preface

members of the Program Committee for the time and effort they devoted to the reviewing of the submitted articles and to the selection process. My thanks go also to the additional reviewers for their help and support. We would like to take this opportunity to thank the local organizing committee, especially its chairman Sunil Vadera, for their superb work. We would like to thank Nigel Linge the head of the School of Computing Science and Engineering, Tim Ritchings the head of the Computer Science, Multimedia and Telecommunication discipline, and Gary Wright from the External Relations Division for their help and support.

Obviously we thank the authors for their high-quality submissions and their participation in this event and their patience during the long reviewing process.

June 2004

Table of Contents

Regular Papers

Natural Language Conversational Systems

A Natural Language Model and a System for Managing TV-Anytime Information from Mobile Devices	1
<i>Anastasia Karanastasi, Fotis G. Kazasis, Stavros Christodoulakis</i>	
State- and Object Oriented Specification of Interactive VoiceXML Information Services	13
<i>Thomas Schwanzara-Bennoit, Gunar Fiedler</i>	
Interpreting Semi-formal Utterances in Dialogs about Mathematical Proofs	26
<i>Helmut Horacek, Magdalena Wolska</i>	

Intelligent Querying

Event Ordering Using TERSEO System	39
<i>Estela Saquete, Rafael Muñoz, Patricio Martínez-Barco</i>	
The Role of User Profiles in Context-Aware Query Processing for the Semantic Web	51
<i>Veda C. Storey, Vijayan Sugumaran, Andrew Burton-Jones</i>	
Deriving FrameNet Representations: Towards Meaning-Oriented Question Answering	64
<i>Gerhard Fliedner</i>	
Lightweight Natural Language Database Interfaces	76
<i>In-Su Kang, Seung-Hoon Na, Jong-Hyeok Lee, Gijoo Yang</i>	
Ontology-Driven Question Answering in AquaLog	89
<i>Vanessa Lopez, Enrico Motta</i>	
Schema-Based Natural Language Semantic Mapping	103
<i>Niculae Stratica, Bipin C. Desai</i>	
Avaya Interactive Dashboard (AID): An Interactive Tool for Mining the Avaya Problem Ticket Database	114
<i>Ziyang Wang, Amit Bagga</i>	

Linguistic Aspects of Modeling

Information Modeling: The Process and the Required Competencies of Its Participants	123
<i>P.J.M. Frederiks, T.P. van der Weide</i>	
Experimenting with Linguistic Tools for Conceptual Modelling: Quality of the Models and Critical Features	135
<i>Nadzeya Kiyavitskaya, Nicola Zeni, Luisa Mich, John Mylopoulos</i>	
Language Resources and Tools for Supporting the System Engineering Process	147
<i>V.O. Onditi, P. Rayson, B. Ransom, D. Ramduny, Ian Sommerville, A. Dix</i>	
A Linguistics-Based Approach for Use Case Driven Analysis Using Goal and Scenario Authoring	159
<i>Jintae Kim, Sooyong Park, Vijayan Sugumaran</i>	

Information Retrieval

Effectiveness of Index Expressions	171
<i>F.A. Grootjen, T.P. van der Weide</i>	
Concept Similarity Measures the Understanding Between Two Agents ...	182
<i>Jesus M. Olivares-Ceja, Adolfo Guzman-Arenas</i>	
Concept Indexing for Automated Text Categorization	195
<i>José María Gómez, José Carlos Cortizo, Enrique Puertas, Miguel Ruiz</i>	

Natural Language Text Understanding

Acquiring Selectional Preferences from Untagged Text for Prepositional Phrase Attachment Disambiguation	207
<i>Hiram Calvo, Alexander Gelbukh</i>	
Semantic Enrichment for Ontology Mapping	217
<i>Xiaomeng Su, Jon Atle Gulla</i>	
Testing Word Similarity: Language Independent Approach with Examples from Romance	229
<i>Mikhail Alexandrov, Xavier Blanco, Pavel Makagonov</i>	

Knowledge Bases

Language Modeling for Effective Construction of Domain Specific Thesauri	242
<i>Libo Chen, Ulrich Thiel</i>	

Populating a Database from Parallel Texts Using Ontology-Based Information Extraction	254
<i>M.M. Wood, S.J. Lydon, V. Tablan, D. Maynard, H. Cunningham</i>	

A Generic Coordination Model for Pervasive Computing Based on Semantic Web Languages	265
<i>Amine Tafat, Michele Courant, Beat Hirsbrunner</i>	

Natural Language Text Understanding

Improving Web Searching Using Descriptive Graphs	276
<i>Alain Couchot</i>	

An Unsupervised WSD Algorithm for a NLP System	288
<i>Iulia Nica, Andrés Montoyo, Sonia Vázquez, M^a Antònia Martí</i>	

Enhanced Email Classification Based on Feature Space Enriching	299
<i>Yunming Ye, Fanyuan Ma, Hongqiang Rong, Joshua Huang</i>	

Synonymous Paraphrasing Using WordNet and Internet	312
<i>Igor A. Bolshakov, Alexander Gelbukh</i>	

Knowledge Management

Automatic Report Generation from Ontologies: The MIAKT Approach	324
<i>Kalina Bontcheva, Yorick Wilks</i>	

A Flexible Workbench for Document Analysis and Text Mining	336
<i>Jon Atle Gulla, Terje Brasethvik, Harald Kaada</i>	

Short Papers

Content Management

Towards Linguistic Foundations of Content Management	348
<i>Gunar Fiedler, Bernhard Thalheim</i>	

Constructing Natural Knowledge Ontologies to Implement Semantic Organizational Memory	354
<i>Laura Campoy-Gomez</i>	

Improving the Naming Process for Web Site Reverse Engineering	362
<i>Sélina Besbes Essanaa, Nadira Lammari</i>	

On Embedding Machine-Processable Semantics into Documents	368
<i>Krishnaprasad Thirunarayan</i>	

Information Retrieval

Using IR Techniques to Improve Automated Text Classification 374
Teresa Gonçalves, Paulo Quaresma

Architecture of a Medical Information Extraction System 380
Dalila Bekhouche, Yann Pollet, Bruno Grilheres, Xavier Denis

Improving Information Retrieval in MEDLINE by Modulating MeSH
Term Weights 388
Kwangcheol Shin, Sang-Yong Han

Identification of Composite Named Entities in a Spanish
Textual Database 395
Sofía N. Galicia-Haro, Alexander Gelbukh, Igor A. Bolshakov

Intelligent Querying

ORAKEL: A Natural Language Interface to an F-Logic
Knowledge Base 401
Philipp Cimiano

Accessing an Information System by Chatting 407
Bayan Abu Shawar, Eric Atwell

Ontology-Based Question Answering in a Federation of University
Sites: The MOSES Case Study 413
*P. Atzeni, R. Basili, D.H. Hansen, P. Missier, Patrizia Paggio,
Maria Teresa Paziienza, Fabio Massimo Zanzotto*

Linguistic Aspects of Modelling

Abstract. The TV-Anytime standard describes structures of categories of digital TV program metadata, as well as User Profile metadata for TV programs. In this case study we describe a natural language model and a system for the users to interact with the metadata and preview TV programs stored in remote databases, from their mobile devices contrary to their limited configurations. By the use of the TV-Anytime metadata specifications the system limits greatly the possibility for ambiguities. The interaction model deals with ambiguities by using the TV-Anytime user profiles and metadata information concerning digital TV to rank the possible answers. The interaction between the user and the system is done by the use of a PDA and a mobile phone with metadata information stored on a database on a remote TV-Anytime compatible TV set.

1 Introduction

The number of digital TV channels has increased dramatically the last few years, and several industrial sectors and content producing sectors are active in defining the environment in which the TVs of the future will operate.

The TV-Anytime Forum is an association of organizations which seeks to develop specifications to enable audio-visual and other services based on mass-market high volume digital storage in consumer platforms - simply referred to as local storage [1]. These specifications target interoperable and integrated systems, from content creators/providers, through service providers, to the consumers and aim to enable applications to exploit the storage capabilities in consumer platforms. The basic architectural unit is an expanded TV set (known as a Personal Digital Recorder – PDR) capable of capturing digital satellite broadcasts according to user interests as they are described in his profile and storing them into large storage devices. The current TV-Anytime standard specifications define the structures for the metadata that can be used to describe TV programs and broadcasts, as well as for the metadata that can be used to describe the user profile. Expanded versions of the TV-Anytime architecture foresee also last mile TV-Anytime servers, Internet connection of the TV set and mobility aspects. Mobile devices (mobile phones, PDAs, etc.) in the TV-Anytime architecture can be used by a user to communicate with the home TV set not only for viewing TV programs, but also for managing the contents of the TV set (like previewing its con-

tents, searching for content, deleting content that has been recorded for him by the TV set, etc.) and for managing his profile preferences [2].

There is a strong need for new interface paradigms that allow the interaction of naïve users with the future TV sets in order to better satisfy their dynamic preferences and access information. The usual pc-based interfaces are not appropriate to interact with mobile devices (like mobile phones or PDAs) or with TV sets. Natural language interfaces (NLIs) are more appropriate interface styles for naïve users, and they can also support voice-based interactions for mobile devices.

The appeal of natural language interfaces to databases has been explored since the beginning of the '80s [6], [7]. Significant advances have been made in dialogue management [3], [4], [5], but the problem of reliable understanding a single sentence has not been solved. In comparison to the efforts made several years ago to enrich the databases with NLIs which faced the prohibitive cost of dialogues to fully clarify the query [3], our environment is more concrete than general purpose interfaces to database systems, since the structure imposed by the TV-Anytime specifications for the metadata greatly limit the possibilities for ambiguities.

The importance of natural language interfaces to databases has increased rapidly the last few years due to the introduction of new user devices (including mobile devices such as PDAs and mobile phones) for which traditional mouse based interfaces are unacceptable. Research has been published in the area of NLIs to interactive TV based information systems [8], [9]. A well-known problem with the NLIs is that user interactions may be ambiguous. Ambiguity in the NLIs is a serious problem and most systems proposed in the literature often lead to lengthy clarification dialogues with the user to resolve ambiguities [14]. These dialogues systems face the problem that the users often do not know the answers to questions asked by the system. Unlike the previous systems we do not resolve the remaining ambiguities with clarification. Instead we can take advantage of the TV-Anytime user profile specifications in order to rank the possible interpretations and present to the user at the top position the one with the highest ranking.

In this paper we present a model for natural language interactions with a TV set in an environment that follows the TV Anytime specifications, both for the TV program metadata as well as for the user profile metadata. The metadata are stored in databases with last mile connections. The natural language interactions are used to preview programs or summaries of programs as well as to completely manage the metadata and the programs that the TV set keeps for the user. In addition we describe an implementation of this TV-Anytime compatible natural language interaction model that works on a PDA and a mobile phone, which communicates with the TV-Anytime TV set for managing its programs and metadata and also allowing the previewing of TV programs from the mobile device.

The best-known dialogue systems that have been developed for digital TV and mobile environments are related to the MIINA project [11] and the Program Guide Information System of NOKIA [12]. In the context of MIINA project, a system has been developed for information retrieval from the set-top-box Mediaternal of NOKIA. The user is allowed to insert queries for TV programs, channels, program categories and broadcast time, using a natural language. However, the natural language interaction in this model is rather simple since it is only related to the information provided by a traditional TV-Guide. The Program Guide Information System is an electronic call-in demo application offering information about television programs

over the phone by allowing the user to converse with the system in natural language sentences. This system is not based on TV-Anytime metadata structures for describing the programs or the user profiles. The scope of the interaction does not include any management of the stored content except retrieval or the user profiles. The main differences between those systems and the one described in this paper is that the present system uses the TV-Anytime content and consumer metadata specifications for a complete management of TV programs and user profiles, and that the system uses additional information that exists in the TV-Anytime User Profile in order to avoid length clarification dialogues and help the user to get the most relevant answers at the top of the result list.

In section 2 of this paper the natural language model for digital TV environment is presented, along with the functionality provided and the representation of the information that the system collects from the user's input. In section 3 we present the algorithm for resolving the ambiguities instead of using clarification dialogues. In section 4 there is the analysis of the system architecture and of the modules that constitute it. Section 5 presents the implementation environment of the system and of the applications from the client side. In section 6 we present an example of a user's utterance and the actions taken by the system in order to satisfy the user's request. Finally section 7 presents the results of the system's evaluation based on user experiments and section 8 concludes by summarizing the content of this paper.

2 The Natural Language Model for the Digital TV Environment

The proposed Natural Language Model allows a user to determine the rules of management of digital TV data (programs and metadata), retrieve TV program content based on any information of its metadata description, express his preferences for the types of TV programs that will be stored, manage his selection list (i.e. programs that have been selected by the PDR or the user himself as candidates for recording), by creating his profile and modify any of the above.

The user's utterance is constituted by a combination of sub-phrase. The categories of these sub-phrases are Introduction phrases, to define the functionality, Search phrases, to define the TV-Anytime information, Target phrases, to define where each of the functions is targeting, Temporal phrases, to define phrases about date and time and Summary phrases, to define summaries with audio/visual content.

The structure that represents the information gathered by the user's utterance is shown in figure 1. This structure consists of three parts namely Element, Element Type and Element Value. The first structure part (Element) is used to differentiate the TV-Anytime metadata information (modeled as *TVA-properties*) from the information that directs the system to the correct management of the user's input (modeled as *flags*). The TV-Anytime information about date and time is modeled as *temporal* Elements. The second structure part (Element Type) is used in order to further specialize the aforementioned information and to obtain its corresponding Element Value (the third structure part), from the user's utterance. When a user inserts an utterance into the system, it generates a feature structure [10] that follows the structure of the model.
