FERTILIZER SUMMARY DATA

By States and Geographical Areas

This revision of *Fertilizer Summary Data* summarizes the U.S. consumption of fertilizer and plant nutrients through fiscal year 1976. It includes Alaska, Hawaii, and Puerto Rico. It also includes TVA's distribution of fertilizer materials for the industry demonstration program for fiscal years 1973 through 1976. Charts show the use of plant nutrients, selected direct application materials, and fertilizer mixtures and materials. Related information includes farm income and expenses.

Acreage harvested and plant nutrients used are shown on two of the leading crops for the states and regions where data is available. This data is the result of an annual survey, and represents estimated figures and includes only four crops (corn for grain, wheat, soybeans, and cotton); totals are shown for the states where these crops are primarily grown. This is the best available data on N, P₂O₅, and K₂O use by crops. The harvested crop acreage is the total of all the principal crops including commercial vegetables.

Fertilizer Summary Data is published as part of TVA's fertilizer research, development, and education program. In meeting the national responsibilities set forth by Congress, TVA has three objectives: (1) to develop new and improved fertilizers and processes for their manufacture in order to lower their cost to the farmer and to increase their effectiveness; (2) to demonstrate the value of the best methods of fertilizer use; and (3) to develop the agricultural resources of the Tennessee Valley. The first two objectives are national in scope; the third is regional.

TVA meets these objectives through research and education—research to develop improved fertilizers and agricultural practices and education to promote their use. The main strength of the program lies in its comprehensive scope of activities, all directed toward the prime objective of benefiting the ultimate consumer—the farmer—rather than toward the profit of some segment of industry that serves the farmer.

To carry out the comprehensive program, TVA has created a unique National Fertilizer Development Center at Muscle Shoals, Alabama. The center consists of facilities and staff for all phases of research related to fertilizer production and use—from fundamental research in test tubes and greenhouses to large-scale research and development in demonstration plants—and provides a base for educational programs carried on throughout the Nation.

Most research and development is conducted in laboratories and small pilot plants. Industry is encouraged to follow all TVA developments closely through visits, special

demonstrations, use of royalty-free licenses on TVA patents, and publications of findings in scientific and trade journals. Successful introduction of new fertilizer materials, however, often requires larger amounts than can be produced either physically or economically in a small pilot plant, and larger scale "demonstration" plants are required. Demonstration plants also provide a proving ground where the more revolutionary new processes can be perfected to a stage that will insure their adoption by industry.

The national farm demonstration program provides experimental fertilizers to cooperating farmers who, under the leadership of agricultural land-grant universities, demonstrate fertilizer use and other improved farming practices. Objectives of the farm demonstration program are: to investigate specific soil fertility and fertilizer use problems important to U.S. agriculture; to evaluate new TVA fertilizers and fertilizer technology; to introduce new TVA fertilizers and fertilizer technology; and to improve fertilizer use efficiency.

The industry demonstration program is more extensive and is aimed at fertilizer manufacturers, distributors, and dealers. Its purpose is to make available to farmers on a large scale the benefits of TVA's research and development. This program introduces new products and encourages improvements in fertilizers, processes, and marketing systems. Fertilizer manufacturers and distributors and their local dealers participate in conveying fertilizer use information to farmers and undertake experiments to improve industry processes and products.

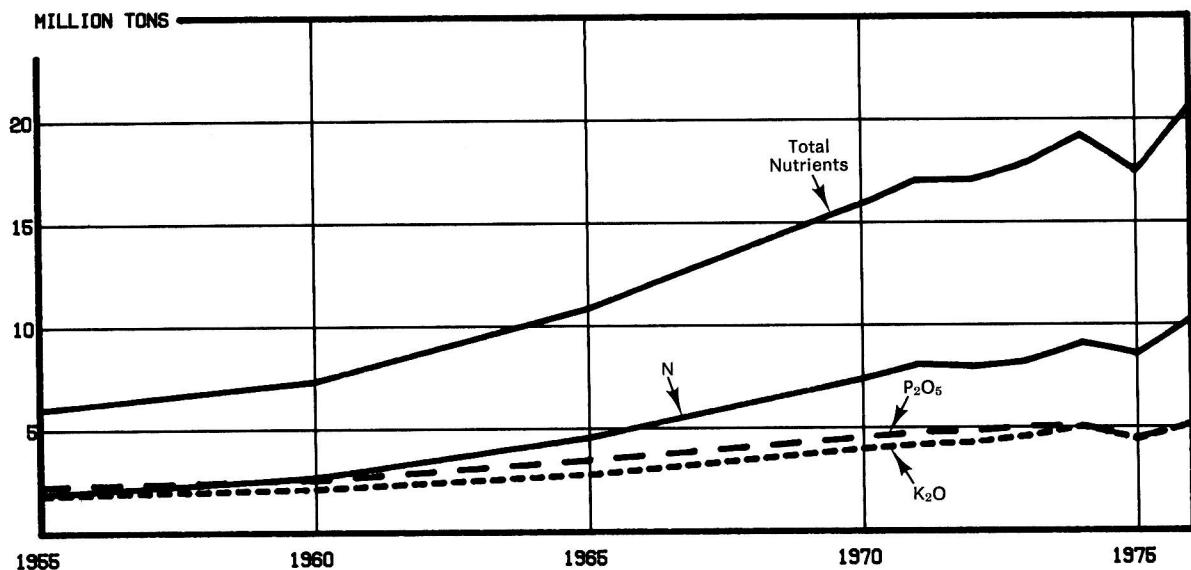

The agricultural resource development program strengthens agriculture in the Tennessee Valley. Its objective is to identify problems and encourage changes which will improve agricultural incomes and resource use. Portions of the Valley program involving fertilizer include rapid adjustment and resource management farms, both of which are demonstrations heavily oriented toward improving management skills and enterprise demonstrations.

TVA's production of experimental fertilizers is determined by the agronomic, economic, and educational contributions each fertilizer can make to the national program. About 20% of all TVA fertilizer is sold for direct application by farmers. The remainder is used by manufacturers who experiment with new techniques to improve their processes and products.

This TVA-college-industry team provides a continuous, integrated fertilizer program from laboratory to farm.
