Preface

Starting with the middle of the 1980s, there has been a growing and fruitful interaction between algebraic geometry and certain areas of theoretical high-energy physics, especially the various versions of string theory. In particular, physical heuristics have provided inspiration for new mathematical definitions (such as that of Gromov–Witten invariants) leading in turn to the solution of (sometimes classical) problems in enumerative geometry. Conversely, the availability of mathematically rigorous definitions and theorems has benefitted the physics research by providing needed evidence, in fields where experimental testing seems still very far in the future.

This process is still ongoing in the present day, and actually expanding. A partial reflection of it can be found in the courses of the CIME session *Enumerative invariants in algebraic geometry and string theory*. The session took place in Cetraro from June 6 to June 11, 2005 with the following courses:

- Dan Abramovich (Brown University): *Gromov–Witten Invariants for Orbifolds*. (5 h)
- Marcos Mariño (CERN): *Open Strings*. (5 h)
- Michael Thaddeus (Columbia University): *Moduli of Sheaves*. (5 h)
- Ravi Vakil (Stanford University): *Gromov–Witten Theory and the Moduli Space of Curves*. (5 h)

Moreover, the following two talks were given as complementary material to the course of Abramovich.

- Jim Bryan (University of British Columbia): *Quantum cohomology of orbifolds and their crepant resolutions*.
- Barbara Fantechi (Sissa): *Virtual fundamental class*.

Orbifolds are a natural generalization of complex manifolds, where local charts are given not by open subsets of a complex vector space but by their quotients by finite groups. There are two natural descriptions, one in terms of charts (which actually works in symplectic geometry) and one in algebraic

geometry as smooth complex Deligne–Mumford stacks. Physicists have long suggested treating orbifolds analogously to manifolds; this has led to the development of an orbifold Euler characteristic, then of orbifold Hodge numbers, and finally (due to Chen–Ruan, in 2000) of an orbifold cohomology, induced by a full theory of Gromov–Witten invariants for orbifolds. The course of Dan Abramovich has presented the foundations, laid down in a series of papers by Abramovich, Vistoli and others, of the definition of Gromov–Witten invariants for orbifolds in the algebraic setting.

The course of Marcos Mariño presented explicit enumerative computations by manipulation of formal power series, based on the physical idea of transforming an open string theory to a closed string theory. The aim was to derive explicit relationships between Gromov–Witten, Donaldson–Thomas and Chern–Simons invariants. In particular, the technique of the topological vertex was explained, which allows a cut-and-paste approach to the determination of such invariants. These methods have only partially received mathematical proofs; they are therefore an important source of conjectures and methods for further developments.

Enumerative geometry computations on moduli spaces of sheaves have long been extremely useful both in physics and in mathematics; for instance we may recall the definition of Donaldson and (more recently) Donaldson–Thomas invariants, for surfaces and (some) threefolds respectively. The course by Michael Thaddeus has been a very broad overview of this kind of techniques, with a particular accent on the definition of the Donaldson–Thomas invariants and the recent conjectures that relate them to Gromov–Witten invariants for Calabi–Yau threefolds; evidence for the conjectures and examples illustrating their significance have also been included.

One of the more established parts of the algebraic geometry – high energy physics interaction has been the rigorous definition and the computation of Gromov–Witten invariants for smooth projective varieties. At the basis of the very definition there is the existence and properness of the moduli stack $\overline{M}_{g,n}$ of stable curves. Surprisingly, in recent years it has been possible to deduce theorems about $\overline{M}_{g,n}$ using the results of the Gromov–Witten theory. The course of Ravi Vakil gave a general introduction to this area of research, starting at a comparatively elementary level and then reaching proofs of some conjectures of C. Faber on the tautological cohomology ring of $\overline{M}_{g,n}$.

We acknowledge the COFIN 2003 “Spazi di moduli e teoria di Lie” for the partial financial support given to this C.I.M.E. session.

We express our deep gratitude to Barbara Fantechi, for her very active role in the organization, for help and for precious scientific advices to the second editor.

Contents

Preface	V
Lectures on Gromov–Witten Invariants of Orbifolds	
<i>D. Abramovich</i>	1
1 Introduction	1
1.1 What This Is	1
1.2 Introspection	1
1.3 Where Does All This Come From?	2
1.4 Acknowledgements	2
2 Gromov–Witten Theory	2
2.1 Kontsevich’s Formula	2
2.2 Set-Up for a Streamlined Proof	3
2.3 The Space of Stable Maps	7
2.4 Natural Maps	8
2.5 Boundary of Moduli	9
2.6 Gromov–Witten Classes	10
2.7 The WDVV Equations	11
2.8 Proof of WDVV	12
2.9 About the General Case	15
3 Orbifolds/Stacks	16
3.1 Geometric Orbifolds	16
3.2 Moduli Stacks	17
3.3 Where Do Stacks Come Up?	19
3.4 Attributes of Orbifolds	19
3.5 Étale Gerbes	20
4 Twisted Stable Maps	21
4.1 Stable Maps to a Stack	21
4.2 Twisted Curves	22
4.3 Twisted Stable Maps	23
4.4 Transparency 25: The Stack of Twisted Stable Maps	24
4.5 Twisted Curves and Roots	25
4.6 Valuative Criterion for Properness	27

5	Gromov–Witten Classes	29
5.1	Contractions	29
5.2	Gluing and Rigidified Inertia	29
5.3	Evaluation Maps	31
5.4	The Boundary of Moduli	32
5.5	Orbifold Gromov–Witten Classes	32
5.6	Fundamental Classes	34
6	WDVV, Grading and Computations	35
6.1	The Formula	35
6.2	Quantum Cohomology and Its Grading	36
6.3	Grading the Rings	38
6.4	Examples	38
6.5	Other Work	41
6.6	Mirror Symmetry and the Crepant Resolution Conjecture	42
A	The Legend of String Cohomology: Two Letters of Maxim Kontsevich to Lev Borisov	43
A.1	The Legend of String Cohomology	43
A.2	The Archaeological Letters	44
	References	46

Lectures on the Topological Vertex

<i>M. Mariño</i>	49
1 Introduction and Overview	49
2 Chern–Simons Theory	51
2.1 Basic Ingredients	51
2.2 Perturbative Approach	55
2.3 Non-Perturbative Solution	61
2.4 Framing Dependence	68
2.5 The $1/N$ Expansion in Chern–Simons Theory	70
3 Topological Strings	73
3.1 Topological Strings and Gromov–Witten Invariants	74
3.2 Integrality Properties and Gopakumar–Vafa Invariants	76
3.3 Open Topological Strings	77
4 Toric Geometry and Calabi–Yau Threefolds	79
4.1 Non-Compact Calabi–Yau Geometries: An Introduction	79
4.2 Constructing Toric Calabi–Yau Manifolds	81
4.3 Examples of Closed String Amplitudes	87
5 The Topological Vertex	89
5.1 The Gopakumar–Vafa Duality	89
5.2 Framing of Topological Open String Amplitudes	89
5.3 Definition of the Topological Vertex	91
5.4 Gluing Rules	93
5.5 Explicit Expression for the Topological Vertex	95
5.6 Applications	96
A Symmetric Polynomials	99
References	100

Floer Cohomology with Gerbes

<i>M. Thaddeus</i>	105
1 Floer Cohomology	106
1.1 Newton's Second Law	106
1.2 The Hamiltonian Formalism	107
1.3 The Arnold Conjecture	108
1.4 Floer's Proof	108
1.5 Morse Theory	109
1.6 Bott–Morse Theory	110
1.7 Morse Theory on the Loop Space	110
1.8 Re-Interpretation #1: Sections of the Symplectic Mapping Torus	112
1.9 Re-Interpretation #2: Two Lagrangian Submanifolds	113
1.10 Product Structures	114
1.11 The Finite-Order Case	115
1.12 Givental's Philosophy	115
2 Gerbes	117
2.1 Definition of Stacks	117
2.2 Examples of Stacks	118
2.3 Morphisms and 2-Morphisms	118
2.4 Definition of Gerbes	120
2.5 The Gerbe of Liftings	121
2.6 The Lien of a Gerbe	122
2.7 Classification of Gerbes	123
2.8 Allowing the Base Space to Be a Stack	123
2.9 Definition of Orbifolds	124
2.10 Twisted Vector Bundles	124
2.11 Strominger–Yau–Zaslow	125
3 Orbifold Cohomology and Its Relatives	126
3.1 Cohomology of Sheaves on Stacks	126
3.2 The Inertia Stack	127
3.3 Orbifold Cohomology	128
3.4 Twisted Orbifold Cohomology	129
3.5 The Case of Discrete Torsion	129
3.6 The Fantechi–Göttsche Ring	130
3.7 Twisting the Fantechi–Göttsche Ring with Discrete Torsion	131
3.8 Twisting It with an Arbitrary Flat Unitary Gerbe	131
3.9 The Loop Space of an Orbifold	132
3.10 Addition of the Gerbe	134
3.11 The Non-Orbifold Case	135
3.12 The Equivariant Case	135
3.13 A Concluding Puzzle	136
4 Notes on the Literature	137
4.1 Notes to Lecture 1	137
4.2 Notes to Lecture 2	139
4.3 Notes to Lecture 3	140

The Moduli Space of Curves and Gromov–Witten Theory

R. Vakil 143

1 Introduction 143

2 The Moduli Space of Curves 145

3 Tautological Cohomology Classes on Moduli Spaces
of Curves, and Their Structure 154

4 A Blunt Tool: Theorem $\star$ and Consequences 173

5 Stable Relative Maps to $\mathbb{P}^1$ and Relative Virtual Localization 177

6 Applications of Relative Virtual Localization 186

7 Towards Faber’s Intersection Number Conjecture 3.23 via Relative
Virtual Localization 190

8 Conclusion 194
