# Cognitive Radio Technology

# Preface

**Dr. Joseph Mitola III**

*Stevens Institute of Technology*

*Castle Point on the Hudson, New Jersey*

This preface<sup>1</sup> takes a visionary look at ideal cognitive radios (iCRs) that integrate advanced software-defined radios (SDRs) with CR techniques to arrive at radios that learn to help their user using computer vision, high-performance speech understanding, GPS navigation, sophisticated adaptive networking, adaptive physical layer radio waveforms, and a wide range of machine learning processes.

---

## CRS KNOW RADIO LIKE TELLME KNOWS 800 NUMBERS

When you dial 1-800-555-1212, a speech synthesis algorithm may say, “Toll Free Directory Assistance powered by TellMe®. Please say the name of the listing you want.” If you mumble, it says, “OK, United Airlines. If that is not what you wanted press 9, otherwise wait while I look up the number.” Reportedly, some 99 percent of the time TellMe gets it right, replacing the equivalent of thousands of directory assistance operators of yore. TellMe, a speech-understanding system, achieves a high degree of success by its focus on just one task: finding a toll-free telephone number. Narrow task focus is one key to algorithm successes.

The cognitive radio architecture (CRA) is the building block from which to build cognitive wireless networks (CWN), the wireless mobile offspring of TellMe. CRs and networks are emerging as practical, real-time, highly focused applications of computational intelligence technology. CRs differ from the more general artificial intelligence (AI) based services (e.g., intelligent agents, computer speech, and computer vision) in degree of focus. Like TellMe, ideal cognitive radios (iCRs) focus on very narrow tasks. For iCRs, the task is to adapt radio-enabled information services to the specific needs of a specific user. TellMe, a network service, requires substantial network computing resources to serve thousands of users at once. CWNs, on the other hand, may start with a radio in your purse or on your belt—a cell phone on steroids—focused on the narrow task of creating from myriad available wireless information networks and resources just what is needed by one user: you. Each CR fanatically serves the needs and protects the personal information of just one owner via the CRA using its audio and visual sensory perception and autonomous machine learning.

---

<sup>1</sup>Adapted from J. Mitola III, *Cognitive Radio Architecture: The Engineering Foundations of Radio XML*, Wiley, 2006.

TellMe is here and now, while iCRs are emerging in global wireless research centers and industry forums such as the Software-Defined Radio Forum and Wireless World Research Forum (WWRF). This book introduces the technologies to evolve SDR to dynamic spectrum access (DSA) and towards iCR systems. It introduces technical challenges and approaches, emphasizing DSA and iCR as a technology enabler for rapidly emerging commercial CWN services.

---

## **FUTURE ICRS SEE WHAT YOU SEE, DISCOVERING RF USES, NEEDS, AND PREFERENCES**

Although the common cell phone may have a camera, it lacks vision algorithms, so it does not see what it is imaging. It can send a video clip, but it has no perception of the visual scene in the clip. With vision processing algorithms, it could perceive and categorize the visual scene to cue more effective radio behavior. It could tell whether it were at home, in the car, at work, shopping, or driving up the driveway at home. If vision algorithms show you are entering your driveway in your car, an iCR could learn to open the garage door for you wirelessly. Thus, you would not need to fish for the garage door opener, yet another wireless gadget. In fact, you would not need a garage door opener anymore, once CRs enter the market. To open the car door, you will not need a key fob either. As you approach your car, your iCR perceives this common scene and, as trained, synthesizes the fob radio frequency (RF) transmission to open the car door for you.

CRs do not attempt everything. They learn about your radio use patterns leveraging a-priori knowledge of radio, generic users, and legitimate uses of radios expressed in a behavioral policy language. Such iCRs detect opportunities to assist you with your use of the radio spectrum, accurately delivering that assistance with minimum tedium.

Products realizing the visual perception of this vignette are demonstrated on laptop computers today. Reinforcement learning (RL) and case-based reasoning (CBR) are mature machine learning technologies with radio network applications now being demonstrated in academic and industrial research settings as technology pathfinders for iCR<sup>2</sup> and CWN.<sup>3</sup> Two or three Moore's law cycles, or three to five years from now, these vision and learning algorithms will fit into your cell phone. In the interim, CWNs will begin to offer such services, presenting consumers with new trade-offs between privacy and ultrapersonalized convenience.

---

## **CRS HEAR WHAT YOU HEAR, AUGMENTING YOUR PERSONAL SKILLS**

The cell phone you carry is deaf. Although this device has a microphone, it lacks embedded speech-understanding technology, so it does not perceive what it hears. It can let you talk to your daughter, but it has no perception of your daughter, nor of your

---

<sup>2</sup>J. Mitola III, *Cognitive Radio Architecture*, 2006.

<sup>3</sup>M. Katz and S. Fitzek, *Cooperation in Wireless Networks*, Elsevier, 2007.

conversation's content. If it had speech-understanding technology, it could perceive your dialog. It could detect that you and your daughter are talking about a common subjects such as a favorite song. With iCR, speech algorithms detect your daughter telling you by cell phone that your favorite song is now playing on WDUV. As an SDR, not just a cell phone, your iCR determines that she and you both are in the WDUV broadcast footprint and tunes its broadcast receiver chipset to FM 105.5 so that you can hear "The Rose." With your iCR, you no longer need a transistor radio in your pocket, purse, or backpack. In fact, you may not need an MP3 player, electronic game, and similar products as high-end CR's enter the market (the CR may become the single pocket pal instead). While today's personal electronics value propositions entail product optimization, iCR's value proposition is service integration to simplify and streamline your daily life. The iCR learns your radio listening and information use patterns, accessing songs, downloading games, snipping broadcast news, sports, and stock quotes you like as the CR reprograms its internal SDR to better serve your needs and preferences. Combining vision and speech perception, as you approach your car, your iCR perceives this common scene and, as you had the morning before, tunes the car radio to WTOP for your favorite "traffic and weather together on the eights."

For effective machine learning, iCRs save speech, RF, and visual cues, all of which may be recalled by the radio or the user, acting as an information prosthetic to expand the user's ability to remember details of conversations, and snapshots of scenes, augmenting the skills of the  $\langle \text{Owner} \rangle$ .<sup>4</sup> Because of the brittleness of speech and vision technologies, CRs may also try to "remember everything" like a continuously running camcorder. Since CRs detect content (e.g., speakers' names and keywords such as "radio" and "song"), they may retrieve content requested by the user, expanding the user's memory in a sense. CRs thus could enhance the personal skills of their users (e.g., memory for detail).

---

## **IDEAL CRS LEARN TO DIFFERENTIATE SPEAKERS TO REDUCE CONFUSION**

To further limit combinatorial explosion in speech, CR may form speaker models—statistical summaries of speech patterns—particularly of the  $\langle \text{Owner} \rangle$ . Speaker modeling is particularly reliable when the  $\langle \text{Owner} \rangle$  uses the iCR as a cell phone to place a call. Contemporary speaker classification algorithms differentiate male from female

---

<sup>4</sup>Semantic Web: Researchers formulate CRs as sufficiently speech-capable to answer questions about  $\langle \text{Self} \rangle$  and the  $\langle \text{Self} \rangle$  use of  $\langle \text{Radio} \rangle$  in support of its  $\langle \text{Owner} \rangle$ . When an ordinary concept, such as "owner," has been translated into a comprehensive ontological structure of computational primitives (e.g., via Semantic Web technology), the concept becomes a computational primitive for autonomous reasoning and information exchange. Radio XML, an emerging CR derivative of the eXtensible Markup Language (XML) offers to standardize such radio-scene perception primitives. They are highlighted in this brief treatment by  $\langle \text{Angle-brackets} \rangle$ . All CR have a  $\langle \text{Self} \rangle$ , a  $\langle \text{Name} \rangle$ , and an  $\langle \text{Owner} \rangle$ . The  $\langle \text{Self} \rangle$  has capabilities such as  $\langle \text{GSM} \rangle$  and  $\langle \text{SDR} \rangle$ , a self-referential computing architecture, which is guaranteed to crash unless its computing ability is limited to real-time response tasks; this is appropriate for a CR but may be too limiting for general-purpose computing.

speakers with a high level of accuracy. With a few different speakers to be recognized (i.e., fewer than 10 in a family) and with reliable side information (e.g., the speaker's telephone number), today's state-of-the-art algorithms recognize individual speakers with better than 95 percent accuracy.

Over time, each iCR can learn the speech patterns of its ⟨Owner⟩ in order to learn from the ⟨Owner⟩ and not be confused by other speakers. The iCR may thus leverage experience incrementally to achieve increasingly sophisticated dialogs. Today, a 3-GHz laptop supports this level of speech understanding and dialog synthesis in real time, making it likely to be available in a cell phone in 3 to 5 years.

The CR must both know a lot about radio and learn a lot about you, the ⟨Owner⟩, recording and analyzing personal information, and the related aggregation of personal information places a premium on trustworthy privacy technologies. Therefore, the CRA incorporates ⟨Owner⟩ speaker recognition as one of multiple soft biometrics in a biometric cryptology framework to protect the ⟨Owner⟩'s personal information with greater assurance and convenience than password protection.

---

## MORE FLEXIBLE SECONDARY USE OF THE RADIO SPECTRUM

In 2008, the US Federal Communications Commission (FCC) issued its second Report and Order (R&O) that radio spectrum allocated to TV, but unused in a particular broadcast market (e.g., because of the transition from analog to digital TV) could be used by CRs as secondary users under Part 15 rules for low-power devices—for example, to create ad hoc networks. SDR Forum member companies have demonstrated CR products with these elementary spectrum-perception and use capabilities. Wireless products, both military and commercial, already implement the FCC vignettes.

Integrated visual- and speech-perception capabilities needed to evolve the DSA CR to the situation-aware iCR are not many years distant. Productization is underway. Thus, many chapters of Bruce's outstanding book emphasize CR spectrum agility, suggesting pathways toward enhanced perception technologies, with new long-term growth paths for the wireless industry. Those who have contributed to this book hope that it will help you understand and create new opportunities for CR technologies.

# Acknowledgments

This Second Edition of *Cognitive RadioTechnology* has been a collaborative effort of many leading researchers in the field of cognitive radio with whom I have had the pleasure of interacting over the last 10 years through participation in the Software Defined Radio Forum, and in some cases, a few of whom I have worked with over nearly my entire career. To each of these contributors, I owe great thanks, as well as to all the other participants in the SDR Forum who have contributed their energy to advance the state of the art. In addition to the authors, each contributor or contributor's team in turn, has also been supported by their staffs and we appreciate their contributions as well.

I owe much to my family, Elizabeth, Alexandra, and Nicholas, who suffered my long distractions with their patience, love, understanding, and substantial help in editing and reviewing. I also owe many thanks to my editor, Sandy Rush, who has patiently guided me through this difficult but very creative process. I dedicate this book to my mother, who provided the perfect mixture of guidance and responsibility; to my grandfather; to my father; and Aunt Margaret, whose early guidance into the many aspects of science led me to this career.

I also acknowledge the support from General Dynamics C4 Systems for the support to work in this exciting new field.

*Bruce A. Fette*

## Chapter 2

This chapter is dedicated to the regulatory community that struggles tirelessly to balance technical rigor with good policy making.

*Pail Kolodzy*

## Chapters 4 and 8

The chapters are dedicated to Mona and Ashley. Thank you both for your love and friendship, and thank you for the time I needed to work on this chapter.

*John Polson*

## Chapter 7

The authors of this chapter wish to thank all of the researchers, colleagues, and friends who have contributed to our work. Specifically, we are pleased to recognize the members of the Virginia Tech research group, including Ph.D. students Bin Le, David Maldonado, and Adam Ferguson; master's students David Scaperoth and Akilah Hugine; and faculty members Allen MacKenzie and Michael Hsiao. Finally, a very big thank you goes to three former colleagues who helped start this research: Christian Rieser, Tim Gallagher, and Walling Cyre.

*Thomas W. Rondeau, Charles W. Bostian*

## Chapter 9

Ronald Brachman, Barbara Yoon, and J. Christopher Ramming helped to refine my understanding of cognition and cognitive networking. Joseph Mitola III and Preston Marshall greatly enhanced my knowledge of radio systems, and Mitola interested me in the intersection of radios and robotics. Harry Lee and Marc Olivieri helped me to understand fine-scale variations in RF reception. Larry Jackel and Thomas Wagner helped me to understand the challenges of decentralized control of robots. In addition, the author is indebted to Joseph Mitola III, Daniel Koditschek, and Bruce Fette for their kindness in reviewing and critiquing draft versions of this chapter.

*Jonathan M. Smith*

## Chapter 10

The work for this chapter was sponsored by the Department of Defense under Air Force contract FA8721-05-C-0002. Opinions, interpretations, conclusions, and recommendations are those of the authors and are not necessarily endorsed by the US government. The authors are grateful to Joe Mitola for creating the DARPA seedling effort that supported this work.

*Joseph P. Campbell, William M. Campbell, Scott M. Lewandowski, Alan V. McCree, Clifford J. Weinstein*

## Chapter 11

Youping Zhao was supported through funding from Cisco, Electronics and Telecommunications Research Institute (ETRI), and Texas Instruments, and advised by Jeffrey H. Reed. Bin Le was supported by the National Science Foundation (NSF) under Grant No. CNS-0519959 and advised by Charles W. Bostian. Special thanks to Bruce Fette, Jody Neel, David Maldonado, Joseph Gaeddert, Lizdabel Morales, Kyung K. Bae, Shiwen Mao, and David Raymond for their helpful discussions and comments. Any opinions, findings, and conclusions or recommendations expressed in this chapter are those of the author(s) and do not necessarily reflect the views of the sponsor(s).

*Youping Zhao, Bin Le, Jeffrey H. Reed*

**Chapter 13**

The work presented in this chapter was partially supported by NSF Grant No. 0225442.

*Mieczyslaw M. Kokar, David Brady, Kenneth Baclawski*

**Chapter 14**

This chapter is dedicated to Lynn , Barb, Max, and Madeline Sophia.

Although the views expressed are exclusively my own, I would like to express appreciation to The MITRE Corporation's commitment to technical excellence in the public interest through which one can step back and study the evolution of cognitive radio architecture from a variety of perspectives—US DoD, military, emergency services, aviation, commercial, and global.

*Joseph Mitola III*

**Chapter 16**

Work done for this chapter was supported by HY-SDR Research Center at Hanyang University, Seoul, Korea, under the ITRC program of Ministry of Knowledge Economy, and by the Korea Science and Engineering Foundation (KOSEF) grant funded by the Korean government to INHA-WiTLAB as a National Research Laboratory.

*Jae Moung Kim, Seungwon Choi, Yusuk Yun, Sung Hwan Sohn, Ning Han, Gyeonghwa Hong, Chiyoungh Ahn*

**Chapter 17**

Research for this chapter was supported by DARPA's neXt Generation Communications Program under Contract Nos. FA8750-05-C-0230 and FA8750-05-C-0150. SRI's XG project web page can be found at <http://xg.csl.sri.com>.

*Grit Denker, Daniel Elenius, David Wilkins*

**Chapter 19**

The work for this chapter was partially supported by DARPA through Air Force Research Laboratory (AFRL) Contract FA8750-07-C-0169. The views and conclusions contained in it are those of the authors and should not be interpreted as representing the official policies, either expressed or implied, of the Defense Advanced Research Projects Agency or the US government.

*Luiz A. Dasilva, Ryan W. Thomas*

**Chapter 21**

The preparation of this chapter was supported by Grant N00014-04-1-0563 from the US Office of Naval Research. Thomas Royster was also supported by a fellowship from the US National Science Foundation. The authors thank Steven Boyd for many beneficial suggestions during the preparation of the chapter.

*Michael B. Pursley, Thomas C. Royster IV*

## Chapter 23

The authors would like to thank the following participants in IEEE activities with whom the direct interactions have been most valuable. Special recognition and acknowledgment for reviewing and commenting: James M. Baker, BAE Systems, Apuvra Mody, BAE Systems, AS&T, IEEE 802.22 voting member. For their contributions, we acknowledge Douglas Sicker and James Hoffmeyer. Recognition is due also to Matt Sherman, Christian Rodriguez, Jacob Wood, David Putnam, Paul Kolodzy, and Vic Hsiao for topical discussions.

*Ralph Martinez, Donya He*

| 8.3               | Network Localization.....   | 270        |
| 8.4               | Additional Geolocation Approaches.....  | 272        |
| 8.5               | Network-Based Approaches.....   | 281        |
| 8.6               | Boundary Decisions .....  | 281        |
| 8.7               | Example of Cellular Phone 911 Geolocation for First Responders .....  | 285        |
| 8.8               | Interfaces to Other Cognitive Technologies.....   | 286        |
| 8.9               | Summary .....   | 287        |
| <b>Chapter 9</b>  | <b>Cognitive Techniques: Three Types of Network Awareness .....</b>   | <b>289</b> |
|                   | <i>Jonathan M. Smith</i>  |            |
| 9.1               | Introduction.....   | 289        |
| 9.2               | Applications and their Requirements.....  | 289        |
| 9.3               | Network Awareness: Protocols .....  | 291        |
| 9.4               | Situation-Aware Protocols in Edge Network Technologies .....  | 295        |
| 9.5               | Network Awareness: Node Capabilities and Cooperation.....   | 297        |
| 9.6               | A Distributed System of Radios—The Radio Team.....  | 298        |
| 9.7               | Network Awareness: Node Location and Cognition for Self-Placement .....                                     | 300        |
| 9.8               | Summary .....   | 302        |
| <b>Chapter 10</b> | <b>Cognitive Services for the User .....</b>  | <b>305</b> |
|                   | <i>Joseph P. Campbell, William M. Campbell, Alan V. McCree, Scott M. Lewandowski, Clifford J. Weinstein</i> |            |
| 10.1              | Introduction.....   | 305        |
| 10.2              | Speech and Language Processing.....   | 306        |
| 10.3              | Concierge Services.....   | 320        |
| 10.4              | Summary .....   | 322        |

|                       |   |                |
|-----------------------|---|----------------|
| <b>Chapter 11</b>     | <b>Network Support: The Radio Environment Map .....</b>                   | <b>325</b>     |
|                       | <i>Youping Zhao, Bin Le and Jeffrey H. Reed</i>                           |                |
| 11.1                  | Introduction.....   | 325            |
| 11.2                  | REM: The Vehicle for Providing Network Support to CRs.....                | 326            |
| 11.3                  | Obtaining Cognition with REM: A Systematic Top-Down Approach .....        | 330            |
| 11.4                  | High-Level System Design of REM.....                                      | 338            |
| 11.5                  | Network Support Scenarios and Applications .....                          | 352            |
| 11.6                  | Example Applications of REM to Cognitive Wireless Networks.....           | 355            |
| 11.7                  | Summary and Open Issues .....   | 363            |
| <br><b>Chapter 12</b> | <br><b>Cognitive Research: Knowledge Representation and Learning.....</b> | <br><b>367</b> |
|                       | <i>Vincent J. Kovarik Jr.</i>   |                |
| 12.1                  | Introduction.....   | 367            |
| 12.2                  | Knowledge Representation and Reasoning.....                               | 371            |
| 12.3                  | Machine Learning .....  | 382            |
| 12.4                  | Implementation Considerations .....                                       | 393            |
| 12.5                  | Summary .....   | 395            |
| <br><b>Chapter 13</b> | <br><b>The Role of Ontologies in Cognitive Radios .....</b>               | <br><b>401</b> |
|                       | <i>Mieczyslaw M. Kokar, David Brady, Kenneth Baclawski</i>                |                |
| 13.1                  | Overview of Ontology-Based Radios .....                                   | 401            |
| 13.2                  | Knowledge-Intense Characteristics of Cognitive Radios .....               | 401            |
| 13.3                  | Ontologies and Their Roles in Cognitive Radio.....                        | 406            |
| 13.4                  | A Layered Ontology and Reference Model .....                              | 412            |
| 13.5                  | Examples.....   | 418            |
| 13.6                  | Open Research Issues.....   | 423            |
| 13.7                  | Summary .....   | 426            |
| <br><b>Chapter 14</b> | <br><b>Cognitive Radio Architecture .....</b>                             | <br><b>429</b> |
|                       | <i>Joseph Mitola III</i>  |                |
| 14.1                  | Introduction.....   | 429            |
| 14.2                  | CRA-I: Functions, Components, and Design Rules .....                      | 431            |
| 14.3                  | CRA-II: The Cognition Cycle .....   | 448            |
| 14.4                  | CRA-III: The Inference Hierarchy.....                                     | 453            |
| 14.5                  | CRA-IV: Architecture Maps.....  | 461            |
| 14.6                  | CRA-V: Building the CRA on SDR Architectures.....                         | 467            |
| 14.7                  | Cognition Architecture Research Topics .....                              | 478            |
| 14.8                  | Industrial-Strength CR Design Rules.....                                  | 478            |
| 14.9                  | Summary and Future Directions.....  | 480            |

|                   |   |            |
|-------------------|---|------------|
| <b>Chapter 15</b> | <b>Cognitive Radio Performance Analysis.....</b>  | <b>483</b> |
|                   | <i>James O. Neel, Jeffrey H. Reed, Allen B. MacKenzie</i>   |            |
| 15.1              | Introduction.....   | 483        |
| 15.2              | The Analysis Problem.....   | 485        |
| 15.3              | Traditional Engineering Analysis Techniques.....  | 491        |
| 15.4              | Applying Game Theory to the Analysis Problem.....   | 502        |
| 15.5              | Relevant Game Models.....   | 511        |
| 15.6              | Summary.....  | 529        |
| <b>Chapter 16</b> | <b>Cognitive Radio in Multiple-Antenna Systems.....</b>   | <b>535</b> |
|                   | <i>Jae Moung Kim, Sung Hwan Sohn, Ning Han, Seungwon Choi, Chiyoungh Ahn, Gyeonghwa Hong, Yusuk Yun</i> |            |
| 16.1              | Introduction.....   | 535        |
| 16.2              | Multiple-Antenna Techniques.....  | 536        |
| 16.3              | Cognitive Capability in an MA System.....   | 541        |
| 16.4              | Application to neXt-Generation Wireless Communications.....   | 553        |
| 16.5              | Summary.....  | 555        |
| <b>Chapter 17</b> | <b>Cognitive Radio Policy Language and Policy Engine.....</b>   | <b>557</b> |
|                   | <i>Grit Denker, Daniel Elenius, David Wilkins</i>   |            |
| 17.1              | Introduction.....   | 557        |
| 17.2              | Benefits of a Policy-Based Approach.....  | 559        |
| 17.3              | NeXt-Generation Spectrum Policy Architecture.....   | 561        |
| 17.4              | Policy Language and Engine Design.....  | 563        |
| 17.5              | SRI Spectrum Policy Language.....   | 567        |
| 17.6              | SRI Policy Engine.....  | 573        |
| 17.7              | SRI Policy Engine Demonstration.....  | 582        |
| 17.8              | Lessons Learned and Future Work.....  | 588        |
| 17.9              | Summary.....  | 590        |
| <b>Chapter 18</b> | <b>Spectrum Sensing Based on Spectral Correlation.....</b>  | <b>593</b> |
|                   | <i>Chad M. Spooner, Richard B. Nicholls</i>   |            |
| 18.1              | Introduction.....   | 593        |
| 18.2              | The Statistical Nature of Communication Signals.....  | 604        |
| 18.3              | Spectrum Sensing Based on Spectral Correlation.....   | 613        |
| 18.4              | Application to Modern Communication Signals.....  | 616        |
| 18.5              | Summary.....  | 629        |
| <b>Chapter 19</b> | <b>Rendezvous in Cognitive Radio Networks.....</b>  | <b>635</b> |
|                   | <i>Luiz A. DaSilva, Ryan W. Thomas</i>  |            |
| 19.1              | Introduction.....   | 635        |
| 19.2              | The Use of Control Channels.....  | 637        |
| 19.3              | Blind Rendezvous.....   | 638        |
