## Foreword

### To the First English Edition

Boundary layer theory is the cornerstone of our knowledge of the flow of air and other fluids of small viscosity under circumstances of interest in many engineering applications. Thus many complex problems in aerodynamics have been clarified by a study of the flow within the boundary layer and its effect on the general flow around the body. Such problems include the variations of minimum drag and maximum lift of airplane wings with Reynolds number, wind tunnel turbulence, and other parameters. Even in those cases where complete mathematical analysis is at present impracticable, the boundary layer concept has been extraordinarily fruitful and useful.

The development of boundary layer theory during its first fifty years is a fascinating illustration of the birth of a new concept, its slow growth for many years in the hands of its creator and his associates, its belated acceptance by others, and the later almost exponential rise in the number of contributors to its further development.

The first decade following the classical paper of Prandtl in 1904 brought forth fewer than 10 papers by Prandtl and his students, a rate of about one paper per year. During the past year over 100 papers were published on various aspects of boundary layer theory and related experiments. The name of H. Schlichting first appears in 1930 with his doctoral thesis on the subject of wake flow. Shortly thereafter Schlichting devoted major effort to the problem of the stability of laminar boundary layer flow.

My own interest in the experimental aspects of boundary layer flow began in the late twenties. With the appearance of Schlichting's papers intensive attempts were made to find the amplified disturbances predicted by the theory. For 10 years the experimental results not only failed to confirm this theory but supported the idea that transition resulted from the presence of turbulence in the free air stream as described in a theory set forth by G. I. Taylor. Then on a well-remembered day in August, 1940, the predicted waves were seen in the flow near a flat plate in a wind tunnel of very low turbulence. The theory of stability described in the papers of Tollmien and Schlichting was soon confirmed quantitatively as well as qualitatively.

German periodicals available in the United States after the war referred to a series of lectures by Schlichting on boundary layer theory which had been published in 1942. This document of 279 pages with 116 figures was not available for some time. An English translation was given limited distribution as NACA Technical Memorandum No. 1217 in 1949. These lectures were completely rewritten to include material previously classified, confidential, or secret from Germany and other countries.

The result was the book of 483 pages and 295 figures published in 1951 in the German language. When this book became known to research workers and educators in the United States, there was an immediate request from several quarters for an English translation, since no comparable book was available in the English language.

The technical content of the present English edition is described in the author's preface. The emphasis is on the fundamental physical ideas rather than on mathematical refinement. Methods of theoretical analysis are set forth along with such experimental data as are pertinent to define the regions of applicability of the theoretical results or to give physical insight into the phenomena.

Aeronautical engineers and research scientists owe a debt of gratitude to Professor Schlichting for this timely review of the present state of boundary layer theory.

Washington D. C., December 13, 1954

Hugh L. Dryden

## Author's Preface to the Second English Edition

The first English edition of this book appeared in 1955. It was not a literal translation of the previous German edition. Taking into account the progress achieved in the meantime, I had completely rewritten two chapters and had made many smaller additions in various places throughout the book. The first English edition was very well received, particularly in the English-speaking countries, and there is little doubt that Dr. J. Kestin's success with the translation contributed to it in no small measure.

The first German edition of "Boundary Layer Theory" was reprinted without changes in 1954, but the new edition went out of print in 1957. Consequently, I have decided to publish a thoroughly revised new edition in the German language. This appeared in 1958 as the third edition of the book. Owing to the great volume of new research results obtained in the intervening period of time, the third edition had to be enlarged by some 120 pages and 80 figures. In particular, the chapters on compressible boundary layers (Chap. XV), on thermal boundary layers (Chap. XIV) and transition (Chaps. XVI and XVII) were considerably increased in size.

Since, in addition, the first English edition went out of print in 1958, I have gladly accepted the suggestion advanced by the two Publishers, Messrs. McGraw-Hill in New York and Messrs. G. Braun in Karlsruhe and prepared a new English edition which more nearly reflects the present status in the development of this branch of science.

I owe a great debt of gratitude to Professor J. Kestin who once more undertook the arduous task of preparing the translation. The present second English edition is based, substantially, on the contents of the third German edition of the book which appeared in 1958. While engaged on the work of translation, Dr. J. Kestin made many valuable suggestions for additions, particularly in Chapters XI and XIV, which I accepted gladly. One of my co-workers, Dr. K. Gersten, rewrote several sections on heat transfer in Chapters XIV and XIX, and I wish to record my thanks to him.

I hope that this new English edition will again be found useful by engineers working in industry and in research establishments and by students of mechanical engineering and machine design as well as by physicists and chemists who have to deal with problems of fluid flow.

Braunschweig, May-1960

H. Schlichting

## Translator's Preface to the Second English Edition

It is once more my pleasure and privilege to record the immense benefits which I derived from my association with Professor H. Schlichting. A very close touch was maintained with the Author during the preparation of this new edition and, moreover, I was given the opportunity of spending two periods of time with Professor

H. Schlichting at his Institutes in Goettingen and Braunschweig during which I learned many things from him. I wish to thank Messrs. McGraw-Hill and the authorities of AGARD for making these memorable visits possible.

I owe a particular debt of gratitude to Dr. P. D. Richardson, Assistant Professor at Brown University and Mr. W. Pechau, Assistant at the Institute for Fluid Mechanics in Braunschweig who kindly consented to read the proofs and who made many valuable suggestions. Both publishers, Messrs. G. Braun of Karlsruhe and Messrs. McGraw-Hill of New York, spared no trouble in meeting our wishes regarding the production of the book.

Braunschweig, May 1960

J. Kestin

### From Author's Preface to First German Edition

Since about the beginning of the current century modern research in the field of fluid dynamics has achieved great successes and has been able to provide a theoretical clarification of observed phenomena which the science of classical hydrodynamics of the preceding century failed to do. Essentially three branches of fluid dynamics have become particularly well developed during the last fifty years; they include boundary layer theory, gas dynamics, and aerofoil theory. The present book is concerned with the branch known as boundary layer theory. This is the oldest branch of modern fluid dynamics; it was founded by L. Prandtl in 1904 when he succeeded in showing how flows involving fluids of very small viscosity; in particular, water and air, the most important ones from the point of view of applications, can be made amenable to mathematical analysis. This was achieved by taking the effects of friction into account only in regions where they are essential, namely in the thin boundary layer which exists in the immediate neighbourhood of a solid body. This concept made it possible to clarify many phenomena which occur in flows and which had previously been incomprehensible. Most important of all, it has become possible to subject problems connected with the occurrence of drag to a theoretical analysis. The science of aeronautical engineering was making rapid progress and was soon able to utilize these theoretical results in practical applications. It did, on the other hand, pose many problems which could be solved with the aid of the new boundary layer theory. Aeronautical engineers have long since made the concept of a boundary layer one of everyday use and it is now unthinkable to do without it. In other fields of machine design in which problems of flow occur, in particular in the design of turbomachinery, the theory of boundary layers made much slower progress, but in modern times these new concepts have come to the fore in such applications as well.

The present book has been written principally for engineers. It is the outcome of a course of lectures which the Author delivered in the Winter Semester of 1941—42 for the scientific workers of the Aeronautical Research Institute in Brunswick. The subject matter has been utilized after the war in many special lectures held at the Engineering University in Brunswick for students of mechanical engineering and physics. Dr. H. Hahnemann prepared a set of lecture notes after the first series of lectures had been given. These were read and amplified by the Author. They were

subsequently published in mimeographed form by the Office for Scientific Documentation (Zentrale für wissenschaftliches Berichtswesen) and distributed to a limited circle of interested scientific workers.

Several years after the war the Author decided completely to re-edit this older compilation and to publish it in the form of a book. The time seemed particularly propitious because it appeared ripe for the publication of a comprehensive book, and because the results of the research work carried out during the last ten to twenty years rounded off the whole field.

The book is divided into four main parts. The first part contains two introductory chapters in which the fundamentals of boundary layer theory are expounded without the use of mathematics and then proceeds to prepare the mathematical and physical justification for the theory of laminar boundary layers and includes the theory of thermal boundary layers. The third part is concerned with the phenomenon of transition from laminar to turbulent flow (origin of turbulence), and the fourth part is devoted to turbulent flows. It is now possible to take the view that the theory of laminar boundary layers is complete in its main outline. The physical relations have been completely clarified; the methods of calculation have been largely worked out and have, in many cases, been simplified to such an extent that they should present no difficulties to engineers. In discussing turbulent flows use has been made essentially only of the semi-empirical theories which derive from Prandtl's mixing length. It is true that according to present views these theories possess a number of shortcomings but nothing superior has so far been devised to take their place, nothing, which is useful to the engineer. No account of the statistical theories of turbulence has been included because they have not yet attained any practical significance for engineers.

As intimated in the title the emphasis has been laid on the theoretical treatment of problems. An attempt has been made to bring these considerations into a form which can be easily grasped by engineers. Only a small number of results has been quoted from among the very voluminous experimental material. They have been chosen for their suitability to give a clear, physical insight into the phenomena and to provide direct verification of the theory presented. Some examples have been chosen, namely those associated with turbulent flow, because they constitute the foundation of the semi-empirical theory. An attempt was made to demonstrate that essential progress is not made through an accumulation of extensive experimental results but rather through a small number of fundamental experiments backed by theoretical considerations.

Braunschweig, October 1950

H. Schlichting

### From Author's Preface to Third (German) Edition

The first edition of this book which appeared in 1951 met with an unexpectedly good reception and the demand for it abroad, particularly in the U.S.A., was very great. Having received many requests from my professional colleagues, I have resolved to bring out an English translation of my book. This was prepared by Dr. J. Kestin of Brown University and appeared in 1955. The English translation

contained numerous additions and modifications at that time, but I found it impossible to revise the whole manuscript thoroughly and in detail in order to bring it completely up to date.

In the present edition I have made an attempt to include all the significant papers which appeared in large numbers during the intervening years. I trust, however, that the revision left the principal aims of the book unaffected and that it still presents the theoretical considerations in a form which is accessible to engineers and that the voluminous experimental material is used principally as a substantiation of and illustration to the analysis. I have retained the original subdivision into Parts and Chapters and endeavoured to encompass all the revisions in the same framework, that is, without introducing any new chapter headings.

It might be useful to enumerate some of the additions: Chapters IX and XIII contain large new sections on exact solutions and the effect of suction; Chapter XV was considerably expanded and in the chapters on transition, particularly in Chapter XVII, I have included numerous examples of the application of the stability theory. The new results on the effect of heat transfer and compressibility on transition have been included. Chapter XXII on turbulent boundary layers has been completely rewritten and is now based on Truckenbrodt's method which leads to convenient quadratures and which has now become widely accepted. In discussing the effect of compressibility on turbulent boundary layers I have confined myself to a few short remarks about flat plates in Chapter XXI. It seems to me that these considerations are still in a fluid state and no definitive treatment can be given. I believe, just as in the previous edition, that I am still justified in not describing the statistical theory of turbulence. This, admittedly, has contributed materially to our better understanding of turbulent flows, but it has not yet acquired any importance for engineers.

The references to individual papers given at the end of each chapter as well as the bibliography at the end of the book have been expanded considerably. The book acquires about 120 new pages and 80 new figures. I trust that in spite of its increased volume, the book still provides a *comprehensive outline* of an important branch of fluid mechanics.

In preparing the manuscript I enjoyed the helpful assistance of several of my professional colleagues, and I wish to put on record my gratitude to them. In particular, I wish to thank Dr. E. Truckenbrodt who helped with the rewriting of Chapter XXII and to Dr. H. Görtler who advised me on the revision of Chapter IX. I also wish to thank my correspondents, too numerous to mention individually by name, who drew my attention to inexactitudes of expression and printing errors. I have made an effort to remove them all.

I would have found it impossible to digest the flood of recent papers without the able assistance which I received from my co-workers, Messrs. K. Gersten, E. Adams and E. G. Feindt. In this connection Mr. N. Scholtz's assistance with the original edition must not be forgotten.

Thanks are due to Messrs. Gersten, Pechau, Riegels and Rotta for their assistance with the reading of the proofs, to my secretary, Miss Behrens, and to my daughter Heike for the careful preparation of the final typescript. Messrs. Braun are to be thanked for their cooperation and for the excellent production of the book.

## List of most commonly used symbols

In order not to depart too drastically from the conventions normally employed in papers on the subject it was found necessary to use the same symbol to denote several different quantities. Thus, for example,  $\lambda$  denotes the resistance coefficient of pipe flow, both laminar and turbulent, and in the theory of stability of laminar boundary layers it denotes the wavelength of a disturbance. Similarly,  $k$  denotes thermal conductivity in the theory of thermal boundary layers, and the height of a protuberance in the discussion of the influence of roughness on turbulent flow.

The following is a list of symbols most commonly used in the book.

### I. General symbols

- $A$  = wetted area, or frontal area
- $d, D$  = diameter
- $g$  = acceleration due to gravity
- $h$  = channel width
- $l, L$  = length
- $p$  = pressure
- $q = \frac{1}{2} \rho V^2$  = dynamic head
- $r, \phi, z$  = cylindrical co-ordinates
- $R$  = radius
- $u$  = mean velocity (in pipe)
- $U(x)$  = velocity in potential flow
- $u, v, w$  = velocity components
- $V$  = free stream velocity
- $\rho$  = density (mass per unit volume)
- $\omega$  = angular velocity

### II. Viscous flow, turbulence

- $A_\tau$  = eddy viscosity
- $b$  = width of jet or wake
- $c_D$  = drag coefficient
- $c_f$  = skin friction coefficient
- $c_f'$  = local skin friction coefficient
- $L, \bar{H}$  = shape factors of velocity profile
- $k$  = height of roughness element (protuberance)
- $k_s$  = height of grain for equivalent sand roughness
- $l$  = mixing length
- $R$  = Reynolds number
- $T$  = turbulence intensity (also degree or level of turbulence)
- $u', v', w'$  = components of turbulent velocity
- $\overline{u'^2}, \overline{v'^2}, \overline{u' v'}$  ... = temporal means of turbulent velocities
- $U$  = maximum velocity at pipe centre

- $U_{\infty}$  = free stream velocity  
 $v_* = \sqrt{\tau_0/\rho}$  = friction velocity  
 $y$  = distance from wall  
 $\delta$  = boundary layer thickness  
 $\delta^*$  = displacement thickness  
 $\varepsilon$  = apparent (virtual) kinematic viscosity in turbulent flow ("eddy viscosity")  
 $\eta = yv_*/\nu$  = dimensionless distance from wall  
 $\theta$  = momentum thickness  
 $\kappa$  = empirical constant in turbulent flow;  $l = \kappa y$   
 $\lambda$  = resistance coefficient of pipe flow  
 $A$  = shape factor of laminar boundary layer velocity profile  
 $\mu$  = absolute viscosity  
 $\nu = \mu/\rho$  = kinematic viscosity  
 $\tau$  = shearing stress (force per unit area)  
 $\tau_0$  = shearing stress at a wall  
 $\phi = u/v_*$  = dimensionless velocity  
 $\psi$  = stream function

### III. Transition from laminar to turbulent flow

- $c = \beta/\alpha = c_r + ic_i$   
 $c_i$  = amplification (or damping) factor  
 $c_r$  = wave propagation velocity of disturbance  
 $R_{crit} = (U_m \delta^*/\nu)_{crit}$  = critical Reynolds number  
 $u', v'$  = velocity components of disturbance  
 $U(y)$  = velocity profile in boundary layer  
 $U_m$  = velocity in potential flow  
 $\beta = \beta_r + i\beta_i$   
 $\beta_i$  = amplification (or damping) factor  
 $\beta_r$  = circular frequency of disturbance  
 $\gamma$  = intermittency factor  
 $\lambda = 2\pi/\alpha$  = wavelength of disturbance  
 $\phi(y)$  = amplitude of stream function of disturbance

### IV. Thermal boundary layers and gasdynamics

- $a = k/\rho c_p$  = thermal diffusivity  
 $c = \sqrt{\gamma p/\rho}$  = velocity of sound  
 $c_p, c_v$  = specific heats at constant pressure and volume, respectively  
 $E = U_{\infty}^2/\rho c_p \Delta T$  = Eckert number (see p. 297)  
 $G = g\beta l^3 \Delta T/\nu^2$  = Grashof number  
 $k$  = thermal conductivity  
 $M = V/c$  = Mach number  
 $N = \alpha l/k$  = Nusselt number  
 $P = \nu/a$  = Prandtl number  
 $q$  = heat flux (quantity of heat per unit area and time)  
 $R_i = -\{(g/\rho)(d\rho/dy)\}/(dU/dy)_w^2$  = Richardson number  
 $S = N/RP$  = Stanton number

$T$	= temperature
$T_{ad}$	= adiabatic wall temperature
$\alpha$	= coefficient of heat transfer
$\beta$	= coefficient of thermal expansion
$\gamma = c_p/c_v$	= isentropic exponent
$\delta_T$	= thickness of thermal boundary layer
$\Delta T$	= temperature difference
$\omega$	= exponent in viscosity-temperature relation

## Abbreviations

The following abbreviations have been used throughout the book:

ARC	Aeronautical Research Council (Great Britain).
R & M	Reports and Memoranda
ASME	American Society of Mechanical Engineers (U.S.A.).
AVA	Aerodynamische Versuchsanstalt Göttingen (Germany).
ETH	Eidgenössische Technische Hochschule, Federal Institute of Technology, Zürich (Switzerland).
NACA	National Advisory Committee for Aeronautics (USA).
NASA	National Aeronautics and Space Administration (USA).
Rep	Report
TM	Technical Memorandum
TN	Technical Note
VDI	Verein Deutscher Ingenieure.
ZAMM	Zeitschrift für angewandte Mathematik und Mechanik.
ZAMP	Zeitschrift für angewandte Mathematik und Physik.
ZFM	Zeitschrift für Flugtechnik und Motorluftschiffahrt.
JAS	Journal of Aeronautical Sciences or Journal of Aero/Space Sciences.

1. Forced and natural flows	302
2. Adiabatic wall	303
3. Analogy between heat transfer and skin friction	303
f. Exact solutions for the problem of temperature distribution in a viscous flow	306
1. Couette flow	310
2. Poiseuille flow through a channel with flat walls	311
g. Thermal boundary layers in forced flow	311
1. Parallel flow past a flat plate at zero incidence	319
2. Thermal boundary layers for other body shapes; theoretical results	324
3. Other body shapes; measurements	326
4. Effect of free-stream turbulence	332
h. Thermal boundary layers in natural flow	339
CHAPTER XV. Boundary layers in compressible flow	339
a. Introductory remarks	341
b. Relation between the velocity and the temperature fields	344
c. The flat plate at zero incidence	350
d. Boundary layer with non-zero pressure gradient	350
1. Exact solutions	355
2. Approximate methods	364
e. Interaction between shock wave and boundary layer	

**Part C. Transition**

CHAPTER XVI. The origin of turbulence I . . . . .	375
a. Some experimental results on transition from laminar to turbulent flow . . . . .	375
1. Transition in pipe flow . . . . .	375
2. Transition in the boundary layer on a solid body . . . . .	378
b. Principles of the theory of stability of laminar flows . . . . .	382
1. Introductory remarks . . . . .	382
2. Foundation of the method of small disturbances . . . . .	383
3. Mathematical form of the disturbance . . . . .	385
4. The eigen-value problem . . . . .	386
5. General properties of the disturbance differential equation . . . . .	388
c. Results of the theory of stability as they apply to the boundary layer on a flat plate at zero incidence . . . . .	391
1. Some older investigations into stability . . . . .	391
2. Tollmien's method for the calculation of the curve of neutral stability . . . . .	392
3. Results for the flat plate . . . . .	396
d. Comparison of the theory of stability with experiment . . . . .	399
1. Older measurements of transition . . . . .	399
2. Verification of the theory of stability by experiment . . . . .	401
CHAPTER XVII. Origin of turbulence II . . . . .	409
a. Effect of pressure gradients on transition in boundary layer along flat walls . . . . .	409
b. Determination of the position of the point of instability for prescribed body shape . . . . .	414
c. Effect of suction on transition in a boundary layer . . . . .	423
d. Effect of body forces on transition . . . . .	428
1. Boundary layers on convex walls (centrifugal forces) . . . . .	428
2. The flow of non-homogeneous fluids (stratification) . . . . .	431
e. Effects due to heat transfer and compressibility . . . . .	433
1. Introductory remark . . . . .	433
2. The effect of the transfer of heat . . . . .	433
3. The effect of compressibility . . . . .	435
f. Stability of a boundary layer in the presence of three-dimensional disturbances . . . . .	439
1. Flow between concentric rotating cylinders . . . . .	439
2. Boundary layers on concave walls . . . . .	440
3. Stability of three-dimensional boundary layers . . . . .	445
g. The influence of roughness on transition . . . . .	445
1. Introductory remark . . . . .	445
2. Single cylindrical roughness elements . . . . .	446
3. Distributed roughness . . . . .	449
h. Axially-symmetrical flows . . . . .	450

**Part D. Turbulent boundary layers**

CHAPTER XVIII. Fundamentals of turbulent flow . . . . .	457
a. Mean motion and fluctuations . . . . .	458
b. Additional, "apparent" turbulent stresses . . . . .	460
c. Derivation of the stress tensor of apparent turbulent friction from the Navier-Stokes equations . . . . .	462
d. Account of some measurements on fluctuating turbulent velocities . . . . .	465
e. Wind tunnel turbulence . . . . .	470
CHAPTER XIX. Theoretical assumptions for the calculation of turbulent flows . . . . .	475
a. Fundamental equations . . . . .	475
b. Prandtl's mixing length theory . . . . .	477
c. Two further assumptions for the turbulent shearing stress . . . . .	480
d. G. I. Taylor's vorticity transfer theory . . . . .	482
e. Von Kármán's similarity hypothesis . . . . .	485

	page
f. Universal velocity distribution law . . . . .	487
1. Von Kármán's velocity distribution law . . . . .	487
2. Velocity distribution from Prandtl's theory . . . . .	488
g. Heat transfer in turbulent flow . . . . .	492
h. Further development of theoretical hypotheses . . . . .	500
CHAPTER XX. Turbulent flow through pipes . . . . .	502
a. Experimental results for smooth pipes . . . . .	502
b. Relation between law of friction and velocity distribution . . . . .	506
c. Universal velocity distribution laws for very large Reynolds numbers . . . . .	508
d. Universal resistance law for smooth pipes at very large Reynolds numbers . . . . .	514
e. Pipes of non-circular cross-section . . . . .	517
f. Rough pipes and equivalent sand roughness . . . . .	519
g. Other types of roughness . . . . .	527
h. Flow in curved pipes . . . . .	529
i. Non-steady flow through a pipe . . . . .	531
CHAPTER XXI. Skin friction drag of a flat plate at zero incidence; Rotating disks; Roughness . . . . .	534
a. The smooth flat plate . . . . .	535
1. Resistance formula deduced from the $1/7$ -th-power velocity distribution law . . . . .	536
2. Resistance formula deduced from the logarithmic velocity distribution law . . . . .	539
3. Further refinements . . . . .	541
4. Influence of Mach number . . . . .	543
b. The rotating disk . . . . .	547
1. The "free" disk . . . . .	547
2. The disk in a housing . . . . .	548
c. The rough plate . . . . .	551
1. The resistance formula for a uniformly rough plate . . . . .	551
2. Measurements on single roughness elements . . . . .	553
3. Transition from a smooth to a rough surface . . . . .	557
d. Admissible roughness . . . . .	557
CHAPTER XXII. The turbulent boundary layer with positive and negative pressure gradient . . . . .	566
a. Some experimental results . . . . .	566
b. The calculation of two-dimensional turbulent boundary layers . . . . .	567
1. General remarks . . . . .	567
2. The characteristic parameters of a boundary layer . . . . .	569
3. Calculation of the momentum thickness . . . . .	571
4. Calculation of the shape factor . . . . .	576
5. Procedure and numerical example . . . . .	579
6. Turbulent boundary layers with suction . . . . .	583
7. Boundary layers on cambered walls . . . . .	584
c. Three-dimensional boundary layers . . . . .	584
1. Boundary layers on bodies of revolution . . . . .	584
2. Boundary layers on rotating bodies . . . . .	585
3. Convergent and divergent boundary layers . . . . .	585
CHAPTER XXIII. Free turbulent flows; jets and wakes . . . . .	590
a. General remarks . . . . .	590
b. Estimation of the increase in width and of the decrease in velocity . . . . .	592
c. Examples . . . . .	596
1. The smoothing out of a velocity discontinuity . . . . .	596
2. Free jet boundary . . . . .	598
3. Two-dimensional wake behind a single body . . . . .	600

	page
4. The wake behind a row of bars . . . . .	604
5. The two-dimensional jet . . . . .	605
6. The circular jet . . . . .	607
d. Inductive theory of turbulence due to H. Reichardt . . . . .	609
e. Heat transfer in free turbulent flow . . . . .	611
<b>CHAPTER XXIV. Determination of profile drag . . . . .</b>	<b>615</b>
a. General remarks . . . . .	615
b. The experimental method due to Betz . . . . .	616
c. The experimental method due to Jones . . . . .	618
d. Calculation of profile drag . . . . .	620
e. Losses in the flow through cascades . . . . .	625
<b>Bibliography . . . . .</b>	<b>633</b>
<b>Index of Authors . . . . .</b>	<b>637</b>
<b>Subject Index . . . . .</b>	<b>643</b>

## Tables

Table 1.1: Viscosity conversion factors . . . . .	6
Table 1.2: Density, viscosity, and kinematic viscosity of water and air in terms of temperature . . . . .	8
Table 1.3: Kinematic viscosity . . . . .	7
Table 2.1: Thickness of boundary layer, $\delta$ , at trailing edge of flat plate at zero incidence in parallel turbulent flow . . . . .	39
Table 5.1: Functions occurring in the solution of plane and axially symmetrical flow with stagnation point. Plane case from L. Howarth and H. Goertler; axially symmetrical case from N. Froessling . . . . .	82
Table 5.2: The functions for the velocity and pressure distribution in the neighbourhood of a disk rotating in a fluid at rest; calculated by W. G. Cochran . . . . .	87
Table 7.1: The function $f(\eta)$ for the boundary layer along a flat plate at zero incidence after L. Howarth . . . . .	121
Table 9.1: Functional coefficients for the first six terms of the Blasius series required in the calculation of two-dimensional boundary layers on a cylinder (symmetrical case) after A. N. Tifford . . . . .	150
Table 10.1: The functions for the velocity distribution for the case of rotation over a stationary wall after A. C. Browning . . . . .	180
Table 10.2: The functional coefficients of the Blasius series for the calculation of the boundary layer on a body of revolution after Froessling . . . . .	189
Table 10.3: The functions $g_0(\eta)$ and $g_2(\eta)$ which occur in problems with stagnation line after Goertler . . . . .	196
Table 11.1: The functions $\zeta_{1a'}$ and $\zeta_{1b'}$ for non-steady impulsive motion after Boltze . . . . .	217
Table 12.1: Results of the calculation of the boundary layer for a flat plate at zero incidence based on approximate theory . . . . .	242
