# Preface

The 9th Asian Computing Science Conference was held in Chiang Mai in December 2004. This volume contains papers that were presented at that conference. The conference was dedicated to Jean-Louis Lassez, on the occasion of his fifth cycle (60th year) birthday. Its theme was “higher-level decision-making”.

Philippe Flajolet was invited to give the opening keynote address, while Yuzuru Tanaka and Phillip Rogaway were also keynote speakers. In addition to the keynote speakers, distinguished colleagues of Jean-Louis Lassez were invited to present talks in his honour. Many of those talks are represented by papers in this volume, but I would like to thank all those speakers:

Jonathan Bernick  
Alex Brodsky  
Vijay Chandru  
T.Y. Chen  
Norman Foo  
Martin Golumbic  
Richard Helm  
Claude Kirchner  
Hélène Kirchner  
Kim Marriott  
Krishna Palem  
Kotagiri Ramamohanarao  
Vijay Saraswat  
Masahiko Sato  
R.K. Shyamasundar  
Nicolas Spyratos  
Andrew Sung  
Pascal Van Hentenryck  
Jean Vuillemin

Following a call for papers, 75 papers were submitted, comprising 47 from Asia, 13 from Europe, 8 from Australia, 5 from North America, and 2 from the Middle East. Submissions came from a total of 23 countries. Korea, China and Thailand were the most-represented countries. These papers underwent anonymous refereeing before the Program Committee selected 17 papers for presentation at the conference. I thank the Program Committee for doing an excellent job under severe time pressure.

I thank the General Chairs of the conference, Joxan Jaffar and Kanchana Kanchanasut, for their support. I thank Pensri Arunwatanamongkol of AIT for her outstanding work in support of the conference website throughout the reviewing process. I thank the Local Organization Committee and its chair, Sanpawat

Kantabutra, for their work on the ground in Chiang Mai. Finally, I thank the Steering Committee for inviting me to chair the Program Committee.

I also recognize the sponsoring institutions for this conference:

Asian Institute of Technology, Thailand

Chiang Mai University, Thailand

IBM Research, USA

INRIA, France

National Electronics and Computer Technology Center, Thailand

National ICT Australia

National University of Singapore

Tata Institute of Fundamental Research, India

Waseda University, Japan

Michael Maher  
Program Chair  
ASIAN 2004

# Organization

## Steering Committee

Joxan Jaffar (National University of Singapore, Singapore)  
Gilles Kahn (INRIA, France)  
Kanchana Kanchansut (Asian Institute of Technology, Thailand)  
R.K. Shyamasundar (Tata Institute of Fundamental Research, India)  
Kazunori Ueda (Waseda University, Japan)

## Program Committee

Vijay Chandru (Strand Genomics and Indian Institute of Science, India)  
T.Y. Chen (Swinburne University, Australia)  
Philippe Codognet (Embassy of France in Tokyo and University of Paris 6, France)  
Susumu Hayashi (Kobe University, Japan)  
Jieh Hsiang (NTU, Taiwan)  
Vitit Kantabutra (Idaho State University, USA)  
Hélène Kirchner (LORIA-CNRS and INRIA, France)  
Jimmy Lee (CUHK, Hong Kong, China)  
Tze Yun Leong (NUS, Singapore)  
Michael Maher (Loyola University Chicago, USA and NICTA, Australia)  
Kim Marriott (Monash University, Australia)  
Krishna Palem (Georgia Institute of Technology, USA)  
Raghu Ramakrishnan (University of Wisconsin, Madison, USA)  
Taisuke Sato (Tokyo Institute of Technology, Japan)  
V.S. Subrahmanian (University of Maryland, College Park, USA)

## Local Organization

Sanpawat Kantabutra (Chiang Mai University, Thailand)

## Referees

David Austin	Yoshitaka Kameya	Kuldip Paliwal
Steven Bird	Yukiyoshi Kameyama	Shawn Parr
Colin Boyd	Vellaisamy Kunalmani	Silvio Ranise
Gerd Brewka	Shonali Krishnaswam	Jochen Renz
Christophe Cerisara	François Lamarche	Seiichiro Sakurai
Lai-Wan Chan	Phu Le	Abdul Sattar
Jeff Choi	Dong Hoon Lee	Jun Shen
Peter Chubb	Ho-Fung Leung	John Shepherd
Leonid Churilov	Guoliang Li	Arcot Sowmya
Johanne Cohen	Lin Li	Peter Stuckey
Véronique Cortier	Jimmy Liu	Changai Sun
Christophe Doche	Jim Lipton	Willy Susilo
Alan Dorin	Eric Martin	Antony Tang
Spencer Fung	Ludovic Mé	Peter Tischer
Claude Godart	Bernd Meyer	Takehiro Tokuda
Michael Goldwasser	Thomas Meyer	Mark Wallace
Guido Governatori	Dale Miller	Kin-Hong Wong
Philippe de Groote	George Mohay	Mariko Yasugi
James Harland	Yi Mu	Akihiro Yamamoto
L.C.K. Hui	Lee Naish	Haruo Yokota
Ryutaro Ichise	Amedeo Napoli	Jane You
Yan Jin	Nicolas Navet	Janson Zhang
Norman Foo	Barry O'Sullivan	
Waleed Kadous	Maurice Pagnucco	

# Table of Contents

## Keynote Papers

Counting by Coin Tossings <i>Philippe Flajolet</i> .....	1
On the Role Definitions in and Beyond Cryptography <i>Phillip Rogaway</i> .....	13
Meme Media for the Knowledge Federation Over the Web and Pervasive Computing Environments <i>Yuzuru Tanaka, Jun Fujima, Makoto Ohigashi</i> .....	33

## Contributed Papers

Probabilistic Space Partitioning in Constraint Logic Programming <i>Nicos Angelopoulos</i> .....	48
Chi-Square Matrix: An Approach for Building-Block Identification <i>Chatchawit Aporntewan, Prabhas Chongstitvatana</i> .....	63
Design Exploration Framework Under Impreciseness Based on Register-Constrained Inclusion Scheduling <i>Chantana Chantrapornchai, Wanlop Surakumpolthorn, Edwin Sha</i> ....	78
Hiord: A Type-Free Higher-Order Logic Programming Language with Predicate Abstraction <i>Daniel Cabeza, Manuel Hermenegildo, James Lipton</i> .....	93
Assessment Aggregation in the Evidential Reasoning Approach to MADM Under Uncertainty: Orthogonal Versus Weighted Sum <i>Van-Nam Huynh, Yoshiteru Nakamori, Tu-Bao Ho</i> .....	109
Learnability of Simply-Moded Logic Programs from Entailment <i>M.R.K. Krishna Rao</i> .....	128
A Temporalised Belief Logic for Specifying the Dynamics of Trust for Multi-agent Systems <i>Chuchang Liu, Maris A. Ozols, Mehmet Orgun</i> .....	142

Using Optimal Golomb Rulers for Minimizing Collisions in Closed Hashing  
*Lars Lundberg, Håkan Lennerstad, Kamilla Klonowska, Göran Gustafsson* ..... 157

Identity-Based Authenticated Broadcast Encryption and Distributed Authenticated Encryption  
*Yi Mu, Willy Susilo, Yan-Xia Lin, Chun Ruan* ..... 169

Deniable Partial Proxy Signatures  
*Yi Mu, Fangguo Zhang, Willy Susilo* ..... 182

Formal Concept Mining: A Statistic-Based Approach for Pertinent Concept Lattice Construction  
*Taweetchai Ouypornkochagorn, Kitsana Waiyamai* ..... 195

A Robust Approach to Content-Based Musical Genre Classification and Retrieval Using Multi-feature Clustering  
*Kyu-Sik Park, Sang-Heon Oh, Won-Jung Yoon, Kang-Kue Lee* ..... 212

Registration of 3D Range Images Using Particle Swarm Optimization  
*Hai V. Phan, Margaret Lech, Thuc D. Nguyen* ..... 223

Zero-Clairvoyant Scheduling with Inter-period Constraints  
*K. Subramani* ..... 236

A Novel Texture Synthesis Based Algorithm for Object Removal in Photographs  
*Feng Tang, Yiting Ying, Jin Wang, Qunsheng Peng* ..... 248

Highly Efficient and Effective Techniques for Thai Syllable Speech Recognition  
*Supachai Tangwongsan, Pornchai Po-Aramsri, Rong Phoophuangpairoj* 259

Robot Visual Servoing Based on Total Jacobian  
*Qingjie Zhao, Zengqi Sun, Hongbin Deng* ..... 271

**Invited Papers**

Online Stochastic and Robust Optimization  
*Russell Bent, Pascal Van Hentenryck* ..... 286

Optimal Constraint Decomposition for Distributed Databases  
*Alexander Brodsky, Larry Kerschberg, Samuel Varas* ..... 301

Adaptive Random Testing <i>T.Y. Chen, H. Leung, I.K. Mak</i> .....	320
Minimal Unsatisfiable Sets: Classification and Bounds <i>Sudeshna Dasgupta, Vijay Chandru</i> .....	330
LPOD Answer Sets and Nash Equilibria <i>Norman Foo, Thomas Meyer, Gerhard Brewka</i> .....	343
Graph Theoretic Models for Reasoning About Time <i>Martin Charles Golumbic</i> .....	352
Rule-Based Programming and Proving: The ELAN Experience Outcomes <i>Claude Kirchner, Hélène Kirchner</i> .....	363
Towards Flexible Graphical Communication Using Adaptive Diagrams <i>Kim Marriott, Bernd Meyer, Peter J. Stuckey</i> .....	380
A Framework for Compiler Driven Design Space Exploration for Embedded System Customization <i>Krishna V. Palem, Lakshmi N. Chakrapani, Sudhakar Yalamanchili</i> ..	395
Spectral-Based Document Retrieval <i>Kotagiri Ramamohanarao, Laurence A.F. Park</i> .....	407
Metadata Inference for Document Retrieval in a Distributed Repository <i>P. Rigaux, N. Spyratos</i> .....	418
A Simple Theory of Expressions, Judgments and Derivations <i>Masahiko Sato</i> .....	437
Reactive Framework for Resource Aware Distributed Computing <i>Rajesh Gupta, R.K. Shyamasundar</i> .....	452
The Feature Selection and Intrusion Detection Problems <i>Andrew H. Sung, Srinivas Mukkamala</i> .....	468
On the BDD of a Random Boolean Function <i>Jean Vuillemin, Frédéric Béal</i> .....	483

**Abstract.** This text is an informal review of several randomized algorithms that have appeared over the past two decades and have proved instrumental in extracting efficiently quantitative characteristics of very large data sets. The algorithms are by nature probabilistic and based on hashing. They exploit properties of simple discrete probabilistic models and their design is tightly coupled with their analysis, itself often founded on methods from analytic combinatorics. Singularly efficient solutions have been found that defy information theoretic lower bounds applicable to deterministic algorithms. Characteristics like the total number of elements, cardinality (the number of distinct elements), frequency moments, as well as unbiased samples can be gathered with little loss of information and only a small probability of failure. The algorithms are applicable to traffic monitoring in networks, to data base query optimization, and to some of the basic tasks of data mining. They apply to massive data streams and in many cases require strictly minimal auxiliary storage.

## 1 Approximate Counting

Assume a blind man (a computer?) wants to locate a single black sheep amongst a flock of  $N - 1$  white sheep. The man can only ask an assistant questions with a Yes/No answer. Like for instance: “*Tell me whether the black sheep is amongst sheep ranked between 37 and 53 from the left*”. This is a variation on the theme of “Twenty Questions”. Clearly, about  $\log_2 N \equiv \lg N$  operations are both necessary and sufficient. (The proof relies on the fact that with  $\ell$  bits of information, you can only distinguish between  $2^\ell$  possibilities, so that one must have  $2^\ell \geq N$ , hence  $\ell \geq \lg N$ .) This simple argument is of an information-theoretic nature. It implies the fact that one cannot keep a counter (the “black sheep”) capable of recording counts between 1 and  $N$  with less than  $\lg N$  bits.

Assume that we want to run a counter known *a priori* to be in the range  $1 \dots N$ . Can one beat the information-theoretic lower bound? Yes and No! Not if we require an exact count as this would contradict the information theoretic argument. But, ... Say we relax the constraints and tolerate an uncertainty on the counts of at most 10% (say) in relative terms. The situation changes dramatically. We now just need to locate our count amongst the terms of a geometric scale,  $1, A, A^2, A^3 \dots$  (till  $N$ ), where  $A = 1.1$ . The problem then becomes that of

finding an interval in a collection of about  $\log_A N$  intervals. Information theory then tells us that this cannot be effected in fewer than

$$\lg \log_A N \approx \lg \lg N + 2.86245$$

bits, but it also tells us that the “amount of information” contained in an approximate answer is of that very same order. For instance, it is conceivable that an algorithm could exist with which counts till  $N = 2^{16} \equiv 65536$  can be maintained using  $8 + 3 = 11$  bits instead of 16.

This is the situation which Robert Morris encountered at Bell Labs in 1977. He needed to maintain the logs of a very large number of events in small registers, since the space available at the time was too small to allow exact counts to be kept. A gain by a factor of 2 in memory against a degradation in accuracy by some 30% was perfectly acceptable. How to proceed? Information theory provides a theoretical possibility, not a solution.

Morris’s solution [23], known as the APPROXIMATE COUNTING Algorithm, goes as follows. In its crudest (binary) version, you maintain a counter  $K$  that initially receives the value  $K := 0$ . Counter  $K$  is meant to be a logarithmic counter, in the sense that when the exact count is  $n$ , the value  $K$  of the counter at that time should be close to  $\lg n$ . Note that the single value that gets stored is  $K$ , which itself only requires  $\lg K \approx \lg \lg n$  bits. Morris’ ingenious idea consists in updating the counter  $K$  to its new value  $K^*$  according to the following procedure:

$$K^* = K + 1 \quad \text{with probability } 2^{-K}; \quad K^* = K \quad \text{with probability } 1 - 2^{-K}.$$

As time goes, the counter increases, but at a smaller and smaller pace. Implementation is especially easy given a (pseudo)random number generator of sorts [21].

The notable fact here is the appeal to a *probabilistic* idea in order to increment the counter. A plausible argument for the fact that  $K$  at time  $n$  should be close to  $\lg n$  is the fact that it takes 1 impulse for the counter to go from value 0 to value 1, then on average 2 more impulses to from 1 to 2, then on average 4 more impulses from 2 to 3, and so on. In other words, a value  $K = \kappa$  should be reached after about

$$1 + 2 + 4 + \cdots + 2^{\kappa-1} = 2^\kappa - 1$$

steps. Thus, provided this informal reasoning is correct, one should have the numeric and probabilistic approximation  $2^\kappa \approx n$ . Then, the algorithm should return at each instant  $n^\circ = 2^K$  as an estimate of the current value of  $n$ .

We have just exposed the binary version of the algorithm, which can at best provide an estimate within a factor of 2 since the values it returns are by design restricted to powers of 2. However, it is easy to change the *base* of the counter: it suffices to replace 2 by a smaller number  $q$  typically chosen of the form  $q = 2^{1/r}$ . Then, the new counter gets updated at basically  $r$  times the rate of the binary counter. Its granularity is improved, as is, we may hope, the accuracy of the result it provides.
