Contents

Risk-Based Inspection/ Reliability-Based Maintenance

Harold Thomas

Achieving Plant Performance Goals by Applying Reliability Centered Maintenance	3
<i>Della Wong and Don Sommerstad</i>	

Reliability Analysis of Steam/Methane and Ethylene Pyrolysis Furnace Tubes	13
<i>Gordon Kallenberg</i>	

Confidence Curves: A Reliability Modeling Technique for the Practical Application of Process Unit and Subsystem Failure Data	25
<i>David J. Silkworth</i>	

How Financially Optimizing Maintenance Can Solve Your Safety Issues	35
<i>Michael E. G. Schmidt and David A. Mauney</i>	

Using Reliability Based Inspection (RBI) as a Means for Safety Data Collection	47
<i>C. Ronald Leonard and Peter N. Lodal</i>	

Techniques for Enhancing Process Safety and System Reliability

Dennis C. Hendershot

- Implementation and Application of the Dow Hazard Evaluation Indices in a Computer-Based Environment** 65

Piyush B. Parikh and Daniel A. Crowl

- Exxon's Worldwide Approach to Incident Investigation Training** 85

J. J. Thomas and W. G. Bridges

- Understanding and Dealing with Human Error in the Oil, Gas and Chemical Industries** 95

Dennis Attwood

- Reliability-Centered Design: Inherently More Reliable Processes Through Superior Engineering Design** 107

David A. Walker, Myron L. Casada, and Randal L. Montgomery

- Achieving Reliable Performance in the Maintenance Organization—An Assessment of Maintenance Performance Indicators** 139

Randal L. Montgomery and Thomas F. Zanin

- Let's Put the "OP" Back in "HAZOP"** 153

Dennis C. Hendershot, Robert L. Post, Paul F. Valerio, James W. Vinson, and Donald K. Lorenzo

- Test Driving the CCPS Plant and Equipment Reliability Database** 169

H. W. Thomas, Bernie Weber, and Mike Moosemiller

The Business Case for Reliability and Risk Management

Peter N. Lodal

- Engineering Process Safety** 187

Ian S. Sutton

Implementation of the SEVESO II Major Accident Hazards Directive in the UK	197
<i>Keith Cassidy</i>	
Measures of Risk When Integrating PSM with Business Decisions	219
<i>T. I. McSweeney, W. W. Simmons, and T. J. Winnard</i>	
Trade-off Risks: Addressing the Tension between Reliability and Safety	235
<i>David F. Montague and James J. Rooney</i>	
Teaching Process Safety to Mechanical Engineers	253
<i>R. Ward</i>	

Process Safety Management Tools

William G. Bridges

CCPS Process Safety Incident Database (PSID)	273
<i>Rick Vaughan and Brian Kelly</i>	
Performance Measurement of Process Safety Management Systems	291
<i>D. J. Campbell, E. M. Connelly, J. S. Arendt, Bob G. Perry, and Sanford Schreiber</i>	

WORKSHOP A

Determining Safety Integrity Levels and Implementing Safety Interlock Systems

Donald Lorenzo

Introduction to ISA TR84.0.02: A Technical Report for Verification of the Target Safety Integrity Level	311
<i>Angela E. Summers</i>	
Safety Instrumented System Design Using Risk–Benefit Evaluation	319
<i>A. Adrian Garcia and Daniel E. Lewis</i>	

The Importance of Software Diagnostic Coverage in Achieving Higher Safety Integrity Levels	337
---	------------

Milton Boyd and David Baer

Unavailability of Emergency Shutdown Systems as Described by Instrument Society of America Standard 84 (S.84).	351
---	------------

A. Adrian Garcia and William K. Lutz

A Validation Tool to Ensure Plant Automation System Reliability	365
--	------------

K. Sandler, J. Cox, M. Barth, and T. Clark

WORKSHOP B

Risk-Based Inspection and Maintenance for Petroleum and Petrochemical Industry— Implementation and Results

Michael Schmidt

Financially Structured Risk-Based Methods from the ASME Application Handbook	381
---	------------

David A. Mauney and Michael E. G. Schmidt

The API Methodology for Risk-Based Inspection (RBI) Analysis for the Petroleum and Petrochemical Industry	399
--	------------

John T. Reynolds

Integrating Reliability-Centered Maintenance Studies with Process Hazard Analyses	419
--	------------

Mike Alley and Matt Long

David Walker and Randy Montgomery

Using the Management-of-Change Database as a Reliability Tool	443
--	------------

K. Sandler and J. Angelo

Risk-Based Inspection: Implementation and Results	451
--	------------

Lynne Kaley and Greg Alvarado

WORKSHOP C

Root Cause Analysis for Risk and Reliability: Approaches, Lessons Learned, and Training Needs

J.J. Thomas

Recurring Causes of Recent Chemical Accidents 459

James C. Belke

Closing the Loop: Case Study: EPA/OSHA Joint Chemical Accident Investigation Report—Napp Technologies, Inc. 469

John Ferris

The Importance of “Why?” 481

W. L. Frank

WORKSHOP D

Developing Practical Human Factors Evaluation Tools

Dennis Attwood

Human Factors Applications in Chemical Process Safety 489

Richard Barke and Vance Calvez

Opportunities for Improving Human Reliability in Process Safety Management 495

Jack Philley

POSTER SESSION

System Reliability Assessment with an Approximate Reasoning Model 521

S. W. Eisenhower, T. F. Bott, T. M. Helm, and S. T. Boerigter

Risk-Based Maintenance for Reliability and Cost Reduction	545
<i>G. J. Wright</i>	

Methodology for Determining Reliability of a Foam Suppression System Using Fuzzy Set Theory and Fault Tree Analysis	561
<i>S. D. Schemel, C. F. Schemel, and V. Van Brunt</i>	

Using a Risk-Based Maintenance Approach to Develop Planned Maintenance Guidelines for Fire Protection Systems	591
<i>John Farquharson, Randy Montgomery, and David Walker</i>	
<i>Ken Dungan, Darryl Brown, and James Begley</i>	

Use of General Industry Failure Rate Data in Fault Tree Analysis for Decision Making	605
<i>William K. Lutz</i>

Achieving Plant Performance Goals by Applying Reliability Centered Maintenance

Della Wong and Don Sommerstad

Strategic Initiatives, NOVA Chemicals Ltd., Red Deer, AB, T4N 6A1

Nova's Joffre site has been in operation for over 19 years and Nova has become increasingly aware of the challenges in achieving and maintaining reliable plant performance. Reliability Centered Maintenance (RCM) was adopted at the Joffre site during a "re-engineering" effort several years ago. RCM was initiated by a business decision to excel at low cost production, a part of which required maintenance teams to research and develop best practices for reliable operation. The benefits of RCM were quantified/validated as part of a recent benchmarking analysis. It indicated that over 50% of maintenance's tasks and labour hours could have been prevented in our \$1.5 billion petrochemical complex.¹ Significant savings could be realized with implementation of RCM. NOVA views RCM as an analytical tool that defines and allocates the "right" maintenance resources.

Equipment reliability is a function of

- inspection records
- design data
- maintenance records and
- management of work procedures.

These are direct inputs into the RCM process. Using a qualitative risk methodology (FMEA) as the framework, RCM focuses on the functionality of equipment in the desired operating environment. By focusing on the function, maintenance tasks are selected to improve the reliability (availability) of process equipment. The implementation of appropriate maintenance allows equipment to be operated reliably for the full life cycle of the plant. The FMEA process is used to identify conceivable failure modes of the components. Results are formatted in a 5x4 risk matrix which was developed in-house. This matrix identifies intolerable risks by incorporating criteria in economic terms, environmental, personnel safety and governmental intervention. It is now used to logically and methodically evaluate equipment performance risks. Follow-up actions are specifically linked to the FMEA results in order to minimize the total risk.

1 WCM Benchmark Analysis of Joffre, March 1998 HSB

A particular case history of a RCM analysis on the Ethylene Plant 1 superheater system is discussed herein.

CASE HISTORY

In this particular case history of an RCM analysis on Ethylene Plant 1's superheaters SH-902 A/B. These two superheaters A and B are vertical cylindrical vessels which superheat saturated steam to 400°C or 752°F (see Figure 1).

The vessels consist of a cylindrical firebox with a convection section

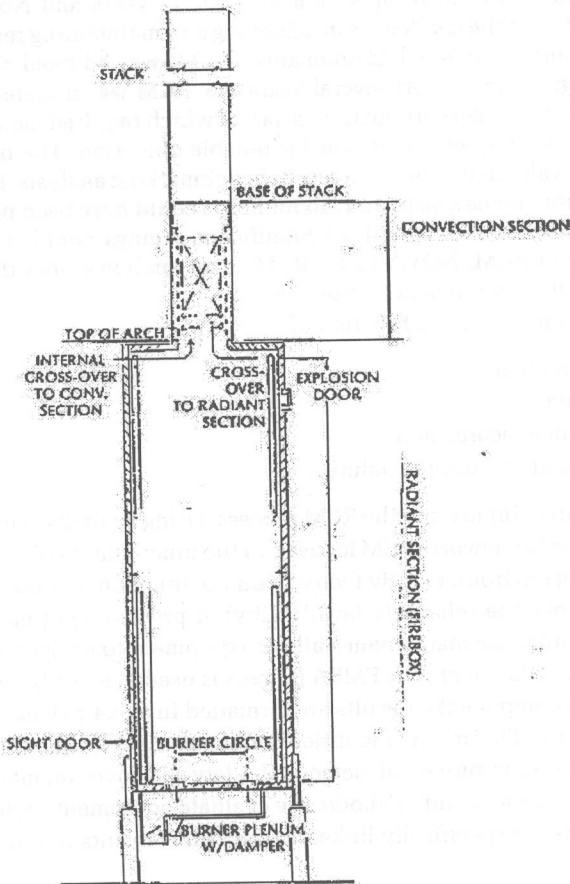

FIGURE 1. Superheater

and stack mounted on it. The superheaters burn plant fuel gas.² On Septem-

FIGURE 2. Location of 20" superheater outlet line in the piperack.

ber 24, 1996 Superheater 902B was put online after maintenance activity. During the warmup, the pressure and temperature were gradually increased to setpoint (400°C), when a large noise and chatter were heard. The plant was evacuated. Upon investigation, the 20" superheater outlet line had catastrophically ruptured (see Figure 2).

The 16" opening (see Figure 3) released 600 psi steam until the operators isolated the superheater. No personnel injuries resulted. However, significant damage and production loss was incurred. The incident investigation recommended that mechanical integrity of the superheater envelope be evaluated.³ As well, the Olefins Reliability Support Team (ORST) was requested to identify areas of inherent unreliability and make recommendations for reliability improvement.

ORST initiated Reliability Centered Maintenance on the superheater system to support the plant's objectives. The RCM cost \$35K and ran over 4 months with 5 RCM team members and resulted in thirty-eight (38) recommendations. The process steps were as follows:

- 2 Olefins Process System 902 Manual, Section 2.0, p.1
- 3 Incident Report, Ethylene 1, SH-902B Line Rupture, September 24, 1996

FIGURE 3. Catastrophic Rupture of 20" Steam Line

STEP 1: FMEA

The RCM team was assembled with operations, maintenance and engineering disciplines familiar with the superheater unit. They agreed upon the deliverables of the RCM analysis which were to:

1. Achieve a 99% Olefins Plant on stream time, which would require zero lost production due to superheater availability, and 99% reliability during process upsets and plant start-ups and shutdowns.
2. Achieve zero major incidents in the superheater area.
3. Eliminate unplanned production reductions due to equipment degradation.
4. Verify the adequacy of the preventive maintenance program to ensure high reliability at an acceptable cost.

Next, the desired functionality and the associated performance standards were defined. Then, the team divided each superheater into logical sub-systems: fuel gas (main burner) system, the natural gas (pilot gas) system, the acid gas system, the combustion air system, the purge steam system, the firebox system, the steam piping system, and the burner management system.

All of these systems were then further divided into components and a list was developed itemizing all equipment within the boundary limits. Each component was analyzed for failure to perform its function with all of the possible causes itemized. Being cognizant of evident or hidden failures
