全国统计教材编审委员会(以下简称:编委会)成立于1988年8月.由近60名统计专家组成,编委会主任由国家统计局副局长担任,是国家统计局领导下的全国统计教材建设工作的最高指导机构和咨询机构。其主要工作任务是:调查研究国内外统计教材建设情况,组织进行统计教材建设研究;制定全国统计教材建设规划;组织编写出版规划统计教材;组织影印、翻译和出版国外优秀统计教材;组织全国高等院校统计教材的质量评估和全国优秀统计教材评选工作:组织开展统计教材的宣传评介和推广使用工作等。

编委会自成立以来,先后制定了"七五"、"八五"、"九五"和"十五"期间全国统计教材建设规划,组织翻译出版了17种国外优秀统计教材。规划选题共53种,已完成编写43种,另外10种教材正在建设。编委会于1991年开展了国家统计局优秀统计教材评奖工作,于1992年在全国普通高等院校中开展了统计教材质量评估和推荐使用工作。到2002年,已组织完成了五轮统计教材质量评估和推荐使用工作,四轮国家统计局优秀统计教材评奖工作,共评选出63种推荐使用教材和42种国家统计局优秀统计教材。"十五"期间,编委会组织引进了"外国优秀统计学教材系列丛书(影印版和翻译版)"。

出版说明

世纪的竞争是人才的竞争,是全球性人才培养机制的较量。 如何培养面向现代化、面向世界、面向未来的高素质的人才 成为我国人才培养的当务之急。为此,教育部发出通知,倡导在全国 普通高等学校中使用原版外国教材,进行双语教学,培养适应经济全 球化的人才。

为了响应教育部的号召,促进统计教材的改革,培养既懂统计专业知识又具备较高英语语言能力的统计人才,全国统计教材编审委员会在国家统计局领导的大力支持下,组织引进了这套"外国优秀统计学教材"。

为了做好"外国优秀统计学教材"引进工作,全国统计教材编审委员会将其列入了"十五"规划,并成立了由海内外统计学家组成的专家委员会。在对国外统计学教材的使用情况进行了充分了解,对国内高等院校使用外国统计学教材的需求情况进行了仔细分析,并对从各种渠道推荐来的统计教材进行了认真审定的基础上,制定了引进教材书目。在确定引进教材书目的过程中,我们得到了国内外有关专家、有关院校和外国出版公司及其北京办事处的支持和帮助,在此致谢。中国人民大学统计学系的吴喜之教授不仅推荐了大量的优秀候选书目,而且校译了影印教材的翻译目录,为这套教材的及早出版作了大量的工作,我们表示衷心的谢意。

这套引进教材多数是国外再版多次、反响良好,又比较适合国内情况、易于教学的统计教材。我们希望这套引进教材的出版对促进 我国统计教材的改革和高校统计学专业双语教学的发展能够起到重要的推动作用。

全国统计教材编审委员会 2002年8月28日

Foreword

A decade ago, Motorola began a journey that would shape the company's success for decades to come. The issue was survival; the challenge was quality; the solution would come from our people. We didn't have a detailed map to guide us but we set out to achieve one very large but simple goal: to improve the way we serve our customers.

Motorola's goal is virtual perfection in everything we do. Perfect quality. Perfect delivery. Perfect reliability. Perfect service. We believe that no defect is tolerable and that perfection is operationally possible. We call it Six Sigma quality.

Where quality was once measured by the number of defective parts per thousand, our Six Sigma goal translates into a defect rate of only 3.4 parts per million in each step of our processes. The goal is a visionary one but our initiative of continuous improvement reaches out for change, refinement, and even revolution in our pursuit of the highest possible quality.

Today it is not a secret that we are all awash in an overload of information, but in reality we cannot have too much relevant data. Too often companies operate in a vacuum—not knowing how their products and services truly stack up against the competition.

At Motorola we use statistical methods daily throughout all of our disciplines to synthesize an abundance of data to drive concrete actions. Only with constant monitoring and continual follow-up can you get a true picture of where you stand and a clear view of where you need to go. We use statistical data to measure both our successes and our failures. More importantly it helps us to manage our future.

How has the use of statistical methods within Motorola Six Sigma initiative, across disciplines, contributed to our growth? Over the past decade we have reduced in-process defects by over 300 fold, which has resulted in a cumulative manufacturing cost savings of over 11 billion dollars. Employee productivity (worldwide) measured in sales dollars per employee has increased three fold or an average 12.2 percent per year over the same 10 year period. Our product reliability as seen by our customer has increased between 5 and 10 times.

Each year over 6,000 Total Customer Satisfaction empowered teams are formed, representing more than 60,000 of our 138,000 employees to solve problems and drive continuous improvement. Over half of these teams are from non-manufacturing disciplines, such as finance, legal, personnel, engineering, and service, all using statistical tools to drive perfection in everything we do.

If you don't set out to achieve perfection, you probably aren't going to achieve it.

Robert W. Galvin Chairman of the Executive Committee Motorola, Inc.

Preface

Modern Industrial Statistics: Design and Control of Quality and Reliability provides the tools for those who drive to achieve perfection in industrial processes. Learn the concepts and methods contained in this book and you will understand what it takes to measure and improve world-class products and services.

The need for constant improvement of industrial processes, in order to achieve high quality, reliability, productivity and profitability, is well recognized. Further, management techniques, such as total quality management and business process reengineering, are insufficient in themselves to achieve the goal without the strong backing of specially tailored statistical procedures, as stated by Robert Galvin in the Foreword.

Statistical procedures designed for solving industrial problems are called Industrial Statistics. Our objective in writing this book was to provide statistics and engineering students, as well as practitioners, the concepts, applications, and practice of basic and advanced industrial statistical methods, which are designed for the control and improvement of quality and reliability.

The idea of writing a text on industrial statistics developed after several years of collaboration in industrial consulting, teaching workshops and seminars, and courses at our universities. We felt that no existing text served our needs in both content and approach so we decided to develop our notes into a text. Our aim was to make the text modern and comprehensive in terms of the techniques covered, lucid in its presentation, and practical with regard to implementation.

Features

Modern Industrial Statistics employs several unique characteristics. Among the most significant is its integration and use of the computer in solving real industrial problems.

- Resampling techniques, or bootstrapping, which occupy a central position in the practice of statistics, have freed the researcher and the practitioner from imposing on a problem theoretical assumptions that are difficult to verify. They can also substitute complex analytical methods for assessing the properties of statistical decision and control procedures. Many regard bootstrapping methods as the inferential and decision-making tools of the 21st century.
- Simulators, which perform simulations, have been specially developed for the
 book to assess the operating characteristics of various process-control procedures
 such as the cycle speed of a piston in a gas turbine and the output current of
 an electrical circuit. These simulators are used in various parts of the book to

generate observations under specific conditions. Our book is unique in its use of the computer as a tool for analysis, design, and control.

- MINITAB is used throughout the book. This package was chosen because of its wide availability, in student or professional versions for Windows, mainframes, or UNIX platforms. Moreover, MINITAB is user friendly, interactive, and easy to teach. An appendix covering the basic features and commands of MINITAB is included.
- In addition, S-PLUS, which has become a package of choice for the more advanced user, is included as well. We furnish all the S-PLUS functions and routines needed for the book in a special appendix.
- Included in the book is a CD-ROM containing all the data sets and the programs that were specifically developed for the book. The programs are either executable files (.EXE) or MINITAB macros (.MTB) stored in subdirectories corresponding to the chapters in which they're first introduced. The S-Plus functions are provided on the CD-ROM as well. The data sets, the simulators, the executable programs, the macros, and the S-PLUS functions are all described in the appendices.
- The book is easily adaptable to other software packages. Faculty interested in using MATLAB, SAS, JMP-IN, STATGRAPHICS, EXCEL, or SPSS can read the data files into other formats by following the data library on the Duxbury Resource Center at www.duxbury.com

Organization and Coverage

The book is comprised of fourteen chapters, organized in two parts. Part I consists of eight chapters, emphasizing statistical thinking in industrial settings, employing data analysis, graphical techniques, and data-based simulations. Most examples in the book are from actual industrial problems, illustrating the versatility and applicability of the statistical methods. Part I includes chapters on probability models, statistical distributions, and estimation and testing of hypotheses. It contains a chapter on sampling from finite populations (needed for bootstrapping and for sampling inspection and auditing of quality), a chapter on bootstrap and nonparametric methods, and a chapter on multiple regression and categorical data analysis. Part II is devoted to six chapters covering basic and advanced methods of industrial control and improvement of quality and reliability. The Solutions Manual contains the complete solutions to all of the problems in the text.

Students taking courses in industrial statistics and using this book will need knowledge of calculus and some matrix theory (linear algebra). We developed the material for upper division undergraduates and beginning graduate students in the fields of Industrial Engineering and Statistics. Students of electrical and mechanical engineering can also benefit from the book. The text can also provide a reference to practitioners working in the areas of quality management, quality engineering, and reliability.

A two-semester course can cover a good part of the book. However, the book was designed to be flexible enough for one-semester courses and several differing course needs. Examples of how the book may be used in one-semester courses are:

Introduction to Industrial Statistics: Chapters 1, 2, 3, 4, 6, 7 Sampling Plans and Reliability: Chapters 4, 5, 6, 7, 9, 14 Statistical Process Control: Chapters 1, 4, 6, 7, 10, 11

Statistics for Quality Design and Improvement: Chapters 4, 6, 8, 10, 12, 13

Advanced Industrial Statistics: Chapters 7, 8, 9, 11, 12, 13, 14.

Acknowledgments

The authors wish to thank their families for their encouragement, the administration of Binghamton University for its support, and the various industries at which they worked or consulted for the opportunity to solve industrial problems. The examples presented in the text have many people behind them and it is impossible to acknowledge all contributors. Among those contributors we should, however, mention several key individuals: Mr. Richard Buetow from Motorola, Mr. Haim Rosen, Mr. Meir Sperling and Mr. Yakov Bantay from Tadiran Telecommunications and Professor Tom Kelley from Binghamton University. We thank the following reviewers for their thoughtful feedback to earlier drafts of the manuscript: James A. Alloway, E.M.S.Q. Associates; Robert L. Armacost, University of Central Florida; Michael Martin, Australian National University, Canberra; P. Simon Pulat, University of Oklahoma; and Derek Rollins, Iowa State University. We wish to thank the editor, Mr. Curt Hinrichs; the editorial staff and accuracy checkers for their excellent suggestions, corrections, and editorial work; and for production editing, Timothy Wardell at Brooks/Cole. Special thanks are due to Mrs. Marge Pratt for her excellent typing of the text.
