Edited by Dave Osborne
- 51 **The coal handbook: Towards cleaner production Volume 2: Coal utilisation**
Edited by Dave Osborne
- 52 **The biogas handbook: Science, production and applications**
Edited by Arthur Wellinger, Jerry Murphy and David Baxter
- 53 **Advances in biorefineries: Biomass and waste supply chain exploitation**
Edited by Keith Waldron
- 54 **Geological storage of carbon dioxide (CO₂): Geoscience, technologies, environmental aspects and legal frameworks**
Edited by Jon Gluyas and Simon Mathias
- 55 **Handbook of membrane reactors Volume 1: Fundamental materials science, design and optimisation**
Edited by Angelo Basile
- 56 **Handbook of membrane reactors Volume 2: Reactor types and industrial applications**
Edited by Angelo Basile
- 57 **Alternative fuels and advanced vehicle technologies for improved environmental performance: Towards zero carbon transportation**
Edited by Richard Folkson
- 58 **Handbook of microalgal bioprocess engineering**
Christopher Lan and Bei Wang

-
- 59 **Fluidized bed technologies for near-zero emission combustion and gasification**
Edited by Fabrizio Scala
- 60 **Managing nuclear projects: A comprehensive management resource**
Edited by Jas Devgun
- 61 **Handbook of Process Integration (PI): Minimisation of energy and water use, waste and emissions**
Edited by Jiří J. Klemes
- 62 **Coal power plant materials and life assessment**
Edited by Ahmed Shibli
- 63 **Advances in hydrogen production, storage and distribution**
Edited by Ahmed Basile and Adolfo Iulianelli
- 64 **Handbook of small modular nuclear reactors**
Edited by Mario D. Carelli and Dan T. Ingersoll
- 65 **Superconductors in the power grid: Materials and applications**
Edited by Christopher Rey
- 66 **Advances in thermal energy storage systems: Methods and applications**
Edited by Luisa F. Cabeza
- 67 **Advances in batteries for medium and large-scale energy storage**
Edited by Chris Menictas, Maria Skyllas-Kazacos and Tuti Mariana Lim
- 68 **Palladium membrane technology for hydrogen production, carbon capture and other applications**
Edited by Aggelos Doukelis, Kyriakos Panopoulos, Antonios Koumanakos and Emmanouil Kakaras
- 69 **Gasification for synthetic fuel production: Fundamentals, processes and applications**
Edited by Rafael Luque and James G. Speight
- 70 **Renewable heating and cooling: Technologies and applications**
Edited by Gerhard Stryi-Hipp
- 71 **Environmental remediation and restoration of contaminated nuclear and NORM sites**
Edited by Leo van Velzen
- 72 **Eco-friendly innovation in electricity networks**
Edited by Jean-Luc Bessede
- 73 **The 2011 Fukushima nuclear power plant accident: How and why it happened**
Yotaro Hatamura, Seiji Abe, Masao Fuchigami and Naoto Kasahara. Translated by Kenji Iino
- 74 **Lignocellulose biorefinery engineering: Principles and applications**
Hongzhang Chen
- 75 **Advances in membrane technologies for water treatment: Materials, processes and applications**
Edited by Angelo Basile, Alfredo Cassano and Navin Rastogi
- 76 **Membrane reactors for energy applications and basic chemical production**
Edited by Angelo Basile, Luisa Di Paola, Faisal I. Hai and Vincenzo Piemonte

Preface

Integration of reaction and separation in a single unit is an elegant approach to increase efficiency and economic advantages of many chemical processes. In particular, the integration of membrane separation units to (bio)chemical reactors can yield the following multidimensional benefits:

1. The ability of such a reactor to circumvent thermodynamic limitations of an equilibrium-controlled process by separating reaction products, as they are produced, allows operation at lower temperatures than the conventional reactors to obtain the same reactant conversion or to convert more reactant at the same temperature.
2. Operating lower reaction temperatures allows reconsideration of heat integration strategy to supply heat duty to reactors.
3. Lower operating temperatures reduce materials cost along with increasing operation safety.
4. The expected significant process simplification and intensification offered by the membrane reactors due to combination of reaction and separation in one step would pave the way to a new industrial paradigm.

The potential of membrane reactors is substantial: they could play a key role not only in case of reversible reactions which conventionally cannot reach high conversions, but also in case of endothermic reactions since the equilibrium shift would allow a higher reactant conversion at lower temperature. In this book, an extensive list of the main reactions (or, better, reaction systems) carried out in membrane reactors is presented. Generally, a comparison with the so-called traditional reactors is also presented in order to better understand the benefits of membrane reactors in terms of conversion, yield, by-product recovery and so on.

The book is composed of three parts: (One) membrane reactors for syngas and hydrogen production (Chapters 1–9); (Two) membrane reactors for other energy applications (Chapters 10–15); and (Three) membrane reactors for basic chemical production (Chapters 15–21).

In detail, Chapter 1 (Iulianelli, Pirola, Comazzi, Galli, Manenti and Basile) delineates the importance of the water gas shift reaction, which is an equilibrium-limited reaction, moderately exothermic, thus, favored at lower temperature. It can be considered the most important reaction involved in all the other system reactions. The chapter describes the recent advancements on this reaction in membrane reactors, paying particular attention to the hydrogen selective membrane utilization for high temperature applications. In Chapter 2 (Basile, Liguori, Iulianelli) the relevant progress achieved in carrying out the methane steam reforming reaction via membrane reactor technology and the effects of the most important parameters affecting this reaction are

described and critically reviewed. An overview on the mathematical models used for simulating the reaction is also presented and discussed. Chapter 3 (Arratibel, Tanaka, van Sint Annaland and Gallucci) discusses the application and the recent advances of membrane reactors for hydrogen production through autothermal reforming reactions, with a focus to the autothermal reforming of methane, methanol and ethanol. Two different configurations of membrane reactors, namely the fluidized bed and the packed bed configuration, are presented and compared. The modeling aspects of both types of reactors are also discussed. The methane dry reforming reaction, discussed in Chapter 4 (Minardi, Chakraborty and Curcio), yields a mixture of hydrogen and carbon monoxide (syngas), and is an important process for many applications. The reaction, from the stoichiometry, produces a higher concentration of carbon monoxide if compared to the methane steam reforming. However, there are some limitations such as the high endothermicity, the catalyst deactivation due to the carbon deposition on the solid active surface and the strong equilibrium limitations. In this chapter it is shown that membrane reactors can help in partially solving the last problem. Chapter 5 (Wang, Dong and Lin) presents the state of the art of hydrogen- and CO₂-selective membranes and membrane reactors for hydrogen production from coal with CO₂ capture. After introducing the traditional technologies for converting coal to hydrogen, the chapter focuses on the advantages and opportunities of membrane reactors with respect to the traditional ones. Finally, the recent progress in membrane reactors for the conversion of gasifier syngas and separation of hydrogen or CO₂ is presented. Another important aspect of membrane reactors is related to the possibility to produce highly pure hydrogen to be fed in a polymer electrolyte membrane fuel cell. In this context, Chapter 6 (Basile, Iulianelli and Tong) deals with the recent findings on both ethanol and methanol reforming reactions, paying attention to the utilization and the potentiality of the membrane reactors technology as well as its advantages over the conventional reactor technology. A short overview of the most representative scientific results on these reforming processes performed in membrane reactors is also discussed. How membrane reactors can improve the conversion and selectivity in water decomposition process for hydrogen production, as well as in NO_x and CO₂ decomposition, is the main focus of Chapter 7 (Ghasemzadeh, Babaluo and Aghaeinejad-Meybodi). In Chapter 8 (Iulianelli, Dalena, Liguori, Calabrò and Basile), glycerol and acetic acid as a bio-derived source are shown as attractive candidates for producing hydrogen through reforming reactions in both conventional and membrane reactors. The recent findings on these reactions are highlighted, with a specific care about the role of the catalyst and the potential of membrane reactor technology with respect to the conventional systems. The main biological reactions involved in the waste-to-biohydrogen process, pointing out the involved enzymatic and cellular systems, are outlined in Chapter 9 (Di Paola, Russo and Piemonte), where the authors also show how membrane reactors, compared with traditional technologies, allow to producing high-purity hydrogen in compact systems and with low environmental impact. Another important fuel for hydrogen production is biodiesel, which is considered as an alternative renewable energy, and has recently received great attention. In Chapter 10 (Rahimpour) it is discussed how all conventional methods in biodiesel production and purification have limitations leading

to an expensive and non-environmental friendly process. It is further demonstrated how membrane reactors can minimize the limitations of the conventional methods. Membrane reactors for bioethanol production and processing are introduced and discussed in Chapter 11 (Hai, Fattah, Saroj and Moreira). In particular, the authors illustrate how membrane technology integrates several process steps that are conventionally separate. The scope of this important chapter is to provide a critical review of the application of membrane technology in various steps of bioethanol production. Moreover, the challenges to widespread deployment of full-scale bioethanol facilities equipped with membrane systems are also discussed. Chapter 12 (Miyamoto, Nakashimada and Uemiya) deals with biomethane that is considered one of the most promising carbon neutral energy. Anaerobic membrane bioreactors are presented as an attractive application for biomethane production. In this context, both the basic principles of anaerobic digestion and the fundamentals of anaerobic membrane bioreactors, including their configurations and membrane materials, are introduced, and their recent progress from the full-scale to lab-scale is also reviewed. Chapter 13 (Chiesa, Manzolini and Romano) considers the application of membranes for oxygen and hydrogen separation in coal gasification plants for power generation and hydrogen production. In this chapter, the focus is on the integration of polymeric and palladium based membranes for hydrogen separation. Different membrane module configurations are illustrated along with the key principles that guide plant design. It is underscored that carbon capture is one of most promising applications of membranes in the energy sector.

In Chapter 14 (Ji and Yang), a brief description of the chemical principles, industrial applications and advantages of the membrane reactors for the desulfurization is firstly given. Secondly, the theory, design and future trends of the use of membrane reactors for the desulfurization of gases and fuels are presented. A discussion and potential of a fuel cell as electrocatalytic membrane reactor is given in Chapter 15 (Datta, Martino and Yen). After introducing the concept and the principles behind the multifarious functions of this membrane reactor, various examples of its application as conventional fuel cells for producing power, unitized regenerative fuel cells for storing power, and a few industrial processes in which electrocatalytic synthesis or separation are presented. Chapter 16 (Itoh) takes into consideration the use of inorganic membrane reactors for the dehydrogenation of hydrocarbons, especially cycloalkanes (cyclohexane and methylcyclohexane), and alkanes (*n*-hexane, and ethyl-side group of aromatics like ethylbenzene). Chapter 17 (Takamura) describes the concept of oxygen permeable membranes based on mixed oxide-ion and electronic conductors and the trend in the related material development. In this chapter, after discussing the various membrane materials, and the development of tape-cast membranes, the fabrication of a prototype of planar-type methane reformer utilizing the ceramics membranes is also described. An exergy analysis is used to show that methane can be reformed to syngas under dry and low S/C conditions by using the membrane reformer. Ammonia, among many other important characteristics, can be considered an alternative energy source with zero CO₂ emission. It also is an important chemical feedstock in chemical industry, and liquid ammonia and ammonium salts have been widely used as fertilizer in farms and these industries have experience in handling ammonia safely. These aspects, and others, are taken into consideration in Chapter 18

(Klinsrisuk, Tao and Irvine) where, after an introduction of the traditional reactors for ammonia production, the advantages of membrane reactors are highlighted. Solid state proton conductors such as perovskites, pyrochlores, fluorites and polymers are reviewed and discussed with particular emphasis on their application in ammonia synthesis. In Chapter 19 (Genduso, Luis and Van der Bruggen) ester compounds are presented together with esterification methodologies and their main industrial applications. This is followed by a comparison between traditional reactors and membrane reactors for esterification reactions. Finally, the state of the art of pervaporation membrane reactors for esterification is presented. Another important application of membrane reactors is related to photocatalysis. In particular, in Chapter 20 (Molinari, Argurio and Lavorato) the photocatalytic hydrogenation of organic compounds in membrane reactors is shown as an alternative to conventional catalytic hydrogenation because it appears a more sustainable method to synthesize organic compounds under mild conditions in the presence of suitable photocatalysts. The chapter, after reviewing the basic principles of both photocatalysis and membrane photoreactors, then discusses photocatalytic hydrogenation of organic compounds. An in-depth overview of the recent progresses in this field, the latest developments of semiconductors and several possible applications of photocatalytic membrane reactors are also demonstrated. In the last chapter, Chapter 21 (Rahimpour), various reactions, such as butene oligomerization, phenol synthesis from benzene, butane partial oxidation and other reactions (e.g. cyclohexane dehydrogenation, ethylbenzene dehydrogenation, and water splitting) carried out in membrane reactors are presented and discussed.

The editors wish to take this opportunity to thank all the authors for their hard work. Special thanks also to the editorial team of Woodhead for their continued helpful support.

List of contributors	xiii
Woodhead Publishing Series in Energy	xv
Preface	xix

Part One Membrane reactors for syngas and hydrogen production 1

1 Water gas shift membrane reactors	3
<i>A. Iulianelli, C. Pirola, A. Comazzi, F. Galli, F. Manenti, A. Basile</i>	
1.1 Water gas shift in conventional reactors	3
1.2 Traditional water gas shift (WGS) process	7
1.3 Catalysts for the WGS reaction	9
1.4 Models for the kinetic interpretation of WGS	11
1.5 WGS regime in Fischer–Tropsch synthesis	12
1.6 Membrane reactor technology for the WGS reaction	16
1.7 Conclusion	24
References	24
Appendix: list of symbols and acronyms	29
2 Membrane reactors for methane steam reforming (MSR)	31
<i>A. Basile, S. Liguori, A. Iulianelli</i>	
2.1 Introduction	31
2.2 Methane steam reforming (MSR) kinetic	35
2.3 MSR and catalysts	36
2.4 MSRs and membrane reactors (MRs)	40
2.5 Conclusion and future trends	51
References	52
Appendix: list of symbols and acronyms	59
3 Membrane reactors for autothermal reforming of methane, methanol, and ethanol	61
<i>A. Arratibel, D.A. Pacheco Tanaka, M. van Sint Annaland, F. Gallucci</i>	
3.1 Introduction: hydrogen production	61
3.2 Methane and other sources for hydrogen	62

3.3	Conventional processes for autothermal reforming	67
3.4	The membrane reactor concepts: packed beds versus fluidized beds	73
3.5	Modeling aspects	78
3.6	Conclusions and future trends	91
	References	92
	Appendix: nomenclature	96
4	Membrane reactors for dry reforming of methane	99
	<i>E.R. Minardi, S. Chakraborty, S. Curcio</i>	
4.1	Introduction	99
4.2	Solid catalysts for methane dry reforming in traditional and membrane reactors	103
4.3	Membrane reactors: why to use them	110
4.4	Membrane reactors for methane dry reforming	117
4.5	Thermal request: a difficult challenge	134
4.6	Methane dry reforming: conclusion and remarks	135
	References	136
	Appendix: acronyms	144
5	Membrane reactors for hydrogen production from coal	145
	<i>H. Wang, X. Dong, Y.S. Lin</i>	
5.1	Introduction	145
5.2	Traditional reactors for hydrogen production from coal and the advantages of membrane reactors	149
5.3	Catalysts for coal gasification	156
5.4	Membrane reactors for hydrogen production from coal	159
5.5	Future trends	174
5.6	Sources of further information and advice	176
	Acknowledgment	177
	References	177
	Appendix: list of symbols	186
6	Membrane reactors for the conversion of methanol and ethanol to hydrogen	187
	<i>A. Basile, A. Iulianelli, J. Tong</i>	
6.1	Introduction	187
6.2	Membrane reactors (MRs)	189
6.3	Ethanol reforming in membrane reactors	191
6.4	Methanol reforming in membrane reactors	197
6.5	Conclusion and future trends	202
	References	203

7	Membrane reactors for the decomposition of H₂O, NO_x and CO₂ to produce hydrogen	209
	<i>K. Ghasemzadeh, A.A. Babaluo, A. Aghaeinejad-Meybodi</i>	
7.1	Introduction	209
7.2	Membrane reactors for H ₂ O decomposition	210
7.3	Membrane reactors for nitrous oxide decomposition	228
7.4	Membrane reactors for CO ₂ decomposition	234
7.5	The main challenges	239
7.6	Conclusion and future trends	239
	References	240
	Appendix: acronyms	247
8	Membrane reactors for steam reforming of glycerol and acetic acid to produce hydrogen	249
	<i>A. Iulianelli, F. Dalena, S. Liguori, V. Calabrò, A. Basile</i>	
8.1	Introduction	249
8.2	Membrane reactor technology	250
8.3	Glycerol steam reforming reaction for hydrogen production	253
8.4	Acetic acid steam reforming reaction for hydrogen production	258
8.5	Conclusion and future trends	262
	References	263
	Appendix: list of symbols and acronyms	266
9	Membrane reactors for biohydrogen production and processing	267
