Preface

Information photonics is an emerging area of interest as it interfaces with the scientific and technological developments in photonics, and the ever-expanding all pervasive applications of information technology. Photonics deals with the generation, transmission, and detection of light in the broader sense, and mostly encompassing the spectra from ultraviolet and visible to the far-infrared wavelengths. On the other hand, information technology deals with the applications of computers and telecommunication equipment to store, retrieve, transmit, and manipulate data. Since the application areas of both photonics and information technology have merged along with the advancement of technology, the area of information photonics is identified as an approach to developing photonic information processing systems, innovatively created by the fusion between photonics technology and information technology.

The word photonics appeared in the late 1960s to describe a research field whose technological goal in those days, was to use light to perform functions that traditionally fell within the typical domain of electronics, such as telecommunication, computation, and other information processing systems. Moreover, photonics was identified as a subset of physics, particularly semiconductor physics, when interest grew in the development of devices after the evolution of laser and optical fibre. As the photonics technologies are entering and expanding into every conceivable domain of public use, the individual boundaries of subject areas are becoming merged. This scenario is unfolding the advantages of today's information age, marked by the high speed of information communication with large bandwidth, which cannot be made without the applications of photonics technology. Information photonics is therefore identified as an approach to developing photonic information processing systems, which are innovatively created as an enabling technology of our information age.

At the outset it is necessary to establish a generic terminology that might be advantageously used in information photonics. During the last 50 years or so, every then-conceivable development in the area of today's photonics was designated with the name of applied optics, optical technology, or optical engineering. When the domain of photonics began to evolve from optics and electronics, various terminologies such as optical-electronic, optronics, and optoelectronics were interchangeably used. Optoelectronics is now considered to be the study and application of electronic devices that can source, detect, and control light, and so optoelectronics is now a sub-field of photonics.

In this book we shall only consider the devices and systems which are governed by the laws of optics to be optical devices and system. On the other hand, when the role of photons and the laws governing them are in play we shall consider those devices and systems to be photonic devices and photonic systems. Therefore, optical fibres are optical devices, but when a system is studied with the addition of sources and detectors, and is used for communication, those systems will be termed photonic communication systems instead of optical communication systems. In the same vein, optical computers will be termed photonic computers, the sources, detectors, and modulators shall be termed photonic detectors, photonic sources, and photonic modulators. A system evolved with the combination of optical and photonic devices shall be called a photonic system.

The main aim of this book is to introduce, to post-graduate students, researchers, engineers, and scientists, the concept of photonic information processing technologies as applied in various fields. It will help readers to get insight into the concepts of photonic information processing as a system, and photonic devices as system components required and applied in the areas of communication, computation, and intelligent pattern recognition. As an extension of these concepts, the areas of quantum communication and computation, where photons have a major role to play, shall also be introduced. The book converges in the last chapter by introducing the emerging areas of nanophotonics, where over and above the systems, photonic crystal and plasmonic devices will have an important role to play in the near future.

The first chapter deals with the basic philosophy of information communication in linear channels in the light of probability and Shannon's theorems. The second chapter introduces the properties of photons, concepts of electromagnetic theory, and an introduction to optical systems and laws. The third chapter deals with the human vision system and the ideas of visual perception, which is an integral part of human interface with systems. Photonic devices play a crucial role in establishing photonic system architectures and therefore the devices required for the generation of photonic signals (sources), those required for the detection of photons, are introduced in the fourth chapter. This chapter, expectedly, will describe the building blocks of the systems. The fifth chapter continues to introduce the devices required for the manipulation of photonic signals (the modulators and switches) and ultimately the photonic storage and display devices.

An important aspect of information processing is the analysis of two dimensional images in space and frequency domains. Chapter 6 addresses this aspect by discussing space and time transform domain information processing techniques by Fourier, fractional Fourier and wavelet transforms. Some other transforms which are helpful in detection problems are also discussed. Chapter 7 deals with low-level information processing of images with the help of operators and morphological processing. This chapter also elaborates photonic instrumentations required for range acquisition and profiling of an object.

Having introduced the photonic devices and basic processing techniques in space and time domain, Chapter 8 of the book deals with the major application of photonic processing in communication and networking. Propagation of light waves in optical fibres, communication in free space, and techniques of secure communication are discussed. Another major area of photonic information processing is photonic computation. Chapter 9 introduces the ideas and architectures of photonic computations, bringing out the arithmetic and logic required for carry-less two-dimensional operations. Since interconnects and switching are integral parts of photonic computing, a portion of this chapter is devoted to the interconnection and switching methods. Chapter 10 deals with the application areas involving photonic information processing in intelligent pattern recognition, mostly using neural network models and image correlation filters. Chapter 11 deals with quantum communication and computation as an aspect of photonic information processing, which is treated as a fusion between photonics and quantum mechanics. The mathematical preliminaries of qubits and devices required are also discussed. The last chapter (Chapter 12) introduces the latest developments in nanophotonic devices and systems. The theories and applications of photonic crystals and plasmonic devices form an integral part of this chapter. The book concludes with a note on the evolution of nanophotonic information systems.

Nowhere in the book are attempts made to derive the equations required to establish a theory behind photonic devices and information processing techniques. Only major equations are mentioned. A large number of books are referred to as additional and supporting reading at the end of each chapter, where the derivations of the equations can be found. Important references are also included at the end of each chapter.

Thanks are due to our colleagues who have assisted us during many phases of preparing the manuscript of the book. Our special gratitude goes to Gagan-deep Singh, CRC Press editorial manager and senior editor (engineering/environmental sciences) without whose support and constant encouragement this book would not have been possible.

Asit Kumar Datta, Soumika Munshi

List of Figures

1.1	Basic probabilistic model of a channel	10
1.2	Basic model of a channel	13
1.3	A typical communication channel	16
1.4	Basic model of a channel with average white Gaussian noise	21
1.5	Condition probabilities and decision regions	24
2.1	Coordinate system for plane wave propagation	52
2.2	Ray propagation in constant $S(r)$ for plane wave and for spherical wave	61
2.3	Ray propagation in an optical system	63
2.4	Representative diffraction regime	66
2.5	Diffraction of a plane wave incident normally on an aperture	67
2.6	(a) Fresnel diffraction of a wire and (b) Fraunhofer diffraction pattern of a rectangular aperture	69
2.7	Young's experiment for the formation of interference pattern	70
3.1	Basic structure of an eye	86
3.2	Basic structure of retina	88
3.3	Distribution of rods and cones in retina	90
3.4	Visual pathways from eye to brain	91
3.5	Signal flow in visual system	92
3.6	Comparative performance of photopic and scotopic vision	94
3.7	CIE $V-\lambda$ curve	96
3.8	Some examples of illusion	100
3.9	An example of visual interpretation and inference	102
3.10	(a) 2D line representation and (b) 3D plane representation	108
3.11	Geometric 2D transformations	109
3.12	Perspective projection model of a pinhole camera	110
3.13	Coordinate system	112
4.1	Energy band diagram of an abrupt p-n junction	124
4.2	Energy band and potentials in (a) forward biased and (b) reverse biased abrupt p-n homojunction	125
4.3	V-I characteristics of a pn junction	128

4.4	Relative differences in bandgaps in 3D and quantum well structure are shown in (a) and (b), quantisations of absorption bands are shown in (c) and (d)	130
4.5	Transition processes in a two-level atomic system: (a) absorption, (b) spontaneous emission, and (c) stimulated emission	133
4.6	Two-level pump involving band	137
4.7	Three-level and four-level transitions	138
4.8	Schematic diagram of a laser cavity	140
4.9	Output characteristics of a laser oscillator	143
4.10	Basic operation of LED	144
4.11	Basic homostructure and heterostructure of a representative LED	146
4.12	Optical power-current relationship of LED	147
4.13	Optical power-current relationship of ILD	150
4.14	Schematic diagram of a double heterostructure structure used in an ILD	151
4.15	Schematic diagram of structure of: (a) distributed feedback (DFB) laser, (b) conventional Fabry-Perot injection diode laser, and (c) distributed Bragg reflector (DBR) of multi-section laser	152
4.16	Schematic structure of a quantum well laser	153
4.17	Representative OLED structure	155
4.18	Current-voltage characteristics of a photodiode at two different power levels of optical illumination	163
4.19	Structure of a diffused p-i-n photodetector	164
4.20	Structure of an APD and its electric field distribution	165
4.21	Depletion-type MOSFET CCD	167
4.22	Shift of potential wells with sequential clocking of gates	168
5.1	Phase modulation using a Pockels cell	181
5.2	Intensity modulation using a Mach-Zehnder interferometer	182
5.3	Phases of liquid crystals: (a) nematic phase, (b) smectic A, (c) smectic B, and (d) cholesteric phase	183
5.4	Molecular orientation of an FLC molecule	184
5.5	(a) A generic electrically addressed liquid crystal cell, and (b) its addressing mode	185
5.6	An electrically addressed liquid crystal cell	186
5.7	Schematic structure of a reflective OASLM	187
5.8	OASLM in incoherent to coherent image conversion	188
5.9	Structure of MOSLM	189
5.10	Acousto-optic diffraction	191
5.11	Deformable mirror device	192
5.12	(a) Torsion type deformable mirror device (side view) and (b) deflection in OFF pixels	193
5.13	Characteristics of intensity bistability	194

5.14	A Fabry-Perot etalon	196
5.15	(a) Schematic structure of a SEED and (b) input/output characteristics of a SEED	196
5.16	Structure of a symmetric SEED (s-SEED)	197
5.17	Hologram (a) recording and (b) read-out	201
5.18	Active matrix addressing	206
5.19	Layers of LC flat panel display	207
5.20	Active matrix addressing of OLED panel (one individual cell is shown)	210
5.21	Flat panel display using OLED	211
5.22	Plasma flat panel display	212
6.1	Log-polar transformation of images	223
6.2	Lens producing an FT at the back focal plane	224
6.3	(a) Translation of wavelet and (b) scaling of wavelet	228
6.4	(a) Morlet wavelet and (b) Mexican hat wavelet	228
6.5	Time-frequency analysis with STFT and continuous wavelet	229
6.6	Heisenberg boxes of (a) wavelet $\psi_{s,\tau}$ and (b) Heisenberg boxes of STFT	232
6.7	Localisation of the discrete wavelets in the time-scale space on a dyadic grid	233
6.8	(a) Time-frequency tiling of FT, (b) time-frequency tiling of STFT, and (c) time-frequency tiling of DWT	234
6.9	Wavelet processing of image	238
6.10	2D wavelet decomposition of image	239
6.11	Two-dimensional projection of image at an angle θ to the vertical axis	240
6.12	Flowchart of reconstruction of image	241
6.13	(a) Projection from 2D image $f(x, Y)$ and (b) image reconstruction from projected data	241
6.14	(a) A straight line in (x_1, y_1) space and (b) a straight line passing through (x_1, y_1) in (m, c) space	242
6.15	(a) A straight line represented by r, θ in (x, y) space and (b) representing lines passing through point (x, y) in the (r, θ) space	243
6.16	Circle detection through the creation of a cone	244
6.17	4f setup	245
6.18	Schematic of photonic setup for the implementation of WT	247
6.19	Arrangement for photonic implementation of Hough transform	247
7.1	Mapping of one pixel with a certain gray value to a different value in a point operation	252
7.2	Mapping of one pixel with a certain gray value to a different value in a point operation	253

7.3	Scaling operation	254
7.4	Fourier plane morphological operation	258
7.5	Morphological operation on test fabric for defect detection	259
7.6	Photonic architecture for morphological operation	259
7.7	Schematic of morphological erosion in shadow-casted technique	260
7.8	Schematic diagram of laser triangulation technique	265
7.9	Schematic diagram of a fringe projection technique	266
7.10	Some of the fringes used in profilometry	267
7.11	Geometry of the phase-measuring system	269
8.1	Fibre optic communication system	279
8.2	Launching of light and its propagation inside the fibre	281
8.3	Different TE modes in an optical fibre	283
8.4	Types of fibre with their profiles and ray-paths within the fibre: (a) multimode step-index, (b) monomode step-index, and (c) graded index	284
8.5	Pulse broadening due to dispersion in a fibre	286
8.6	Attenuation in optical fibre at different wavelengths	288
8.7	Some of the modulation codes used in optical communication	290
8.8	Various network topologies: (a) point-to-point, (b) bus, (c) star, and (d) ring type	296
8.9	(a) A two-fibre ring pair in fibre distributed data interface (FDDI) network and (b) use of primary and secondary fibres in the case of a fibre break in an FDDI ring	297
8.10	WDM in an optical fibre communication system	298
8.11	Wavelength routing network	300
8.12	Routing schemes: (a) unicast, (b) broadcast, (c) anycast, (d) multicast, and (e) geocast	300
8.13	Modeling a photonic cross-connect	302
8.14	Block diagram of an add/drop multiplexer	303
8.15	Add/drop multiplexer using optical switch or grating	303
8.16	Add/drop filter using fibre grating, couplers, and isolators	304
8.17	An access network	305
8.18	Synchronous digital hierarchy (SDH) ring-network	306
8.19	Generic optical amplifier	307
8.20	Energy levels in erbium	307
8.21	Orthogonal states or basis of BB84 protocol	310
8.22	Encoding by double random phase code in a 4f setup	311
8.23	Encoding by double random phase code in a JTC architecture	312
9.1	Schematic of SIMD architecture	321
9.2	Schematic of MIMD architecture	322
9.3	Schematic of a photonic computing architecture	327
9.4	Schematic of an OPAL architecture	332

9.5	Schematic diagram of (a) space variant and (b) space invariant networks	333
9.6	Schematic diagram of (a) space variant and (b) space invariant networks	334
9.7	Schematic diagram of the perfect shuffle network with $N = 8$	334
9.8	Schematic of (a) banyan network and (b) crossover network	335
9.9	(a) Single cell operation of optical shadow-casting architecture and (b) coding of input A and B	346
9.10	Multicell operation of optical shadow casting technique . . .	347
9.11	Schematic diagram of (a) architecture for implementing arithmetic and logical operations and (b) partition of SLM into three areas R, S, and T distances	348
9.12	(a) Cell structure generated effectively modulates the source array to perform signed Ex-OR operation on the operands. (b) (4×4) cell decoding mask for each bit of the projected superimposed input.	350
9.13	Bit-wise superimposition of the (3×3) patterns of the two input operands	350
9.14	Resultant superimposed input combinations of each bit of A and B when (a) operands A and B are converted to signed and unsigned negabinary forms, respectively, and (b) operands A and B are converted to unsigned and signed negabinary forms, respectively	351
9.15	Resultant superimposed input combinations of each bit of A and B: (a) superimposed patterns of the addend and augend in two channels, (b) projected pattern of superimposed pattern for addition in the two channels (thick-bordered cells represent the cells to be scanned), and (c) scanned coefficients in the thick-bordered cells	352
9.16	Design of cell-structure in front of the lenslet array for some logic operations	353
9.17	Coding of the three inputs to flip-flop	354
9.18	(3×3) source modulated by SLM	354
9.19	Source pattern and decoding masks for different flip-flops: (a) type of flip-flop, (b) source pattern, and (c) decoding mask .	355
9.20	Schematic diagram of the matrix-vector multiplication process. S: laser source; LA: lenslet array; P1: source control SLM; CL: cylindrical lens; L: condensing lens; P2: SLM; D: detector array	360
9.21	Schematic diagram of a hybrid photonic multiprocessor . . .	361
9.22	Schematic diagram of an all-optical digital multiprocessor .	361
9.23	Block diagram of AT&T digital optical multiprocessor . . .	362
10.1	Schematic diagram of a VLC architecture	372
10.2	Optical arrangement of the VLC architecture	373

10.3	Basic frequency domain correlation technique for face recognition	374
10.4	Pictorial representation of PSR metric evaluation from correlation plane output	376
10.5	Optical arrangement of the hybrid digital-optical correlation architecture	386
10.6	Schematic diagram of the JTC architecture	387
10.7	Flowchart for obtaining JTC	390
10.8	Schematic diagram of photonic JTC	391
10.9	Schematic diagram of single SLM photonic JTC	391
10.10	Optical arrangement of the JTC architecture	392
10.11	A simple processing element (PE)	394
10.12	Transfer functions: (a) step function, (b) linear threshold function, (c) sigmoid function	395
10.13	Perceptron model	397
10.14	Ex-OR classification problem	398
10.15	Multilayer perceptron model	399
10.16	Hopfield model of ANN	401
10.17	Hopfield auto-associative model	402
10.18	Boltzmann machine	403
10.19	Kohonen's self-organising map	404
10.20	Carpenter-Grossberg model of adaptive resonance theory	405
10.21	Holographic architecture for implementing perceptron network	407
10.22	Hybrid photonic architecture for implementing perceptron network	407
10.23	(a) Set of training input patterns where the associations are (A,S) and (P,D), and (b) output of associated pattern S even if the given input pattern A is distorted	412
10.24	(a) Frame T^i showing the outer-product matrix for the vector $(A^1), C^i$, (b) frame T^j showing the outer-product matrix for the vector $(A^j), C^j$, and (c) sum of the outer product matrix $(T^i + T^j)$	413
10.25	Scheme of (a) recording and (b) readout of outer product matrix	414
10.26	Scheme of (a) recording and (b) readout of outer product matrix	415
10.27	Stored pattern pairs	420
10.28	Hetero-associative recall of patterns	421
10.29	Operational flowchart of the hetero-associative architecture	422
10.30	Three-layer associative memory model	423
10.31	Photonic architecture for WTA model	424
10.32	Photonic architecture for three-layer hetero-associative memory with WTA	425

11.1	Visualisation of (a) classical bits and (b) qubits	436
11.2	Representation of qubit states in a spherical surface	437
11.3	Notation used for representing qubit gates	451
11.4	Notation used for representing some quantum gate circuits	452
11.5	Register operation using (a) classical bits and (b) qubits	452
11.6	(a) Classical and (b) quantum cryptography system	455
11.7	Teleportation model by a 3-bit system	461
12.1	Representative 1D, 2D, and 3D photonic crystal structure (re-drawn from [11])	470
12.2	(a) 1D structure with unidirectional periodicity of permittivity, (b) photonic band structure for propagation perpendicular to the structure for the same permittivity, and (c) formation of photonic bandgap when permittivity is periodic, as shown in (a)	474
12.3	(a) Square lattice of photonic crystal and (b) Brillouin zone of square lattice (irreducible zone is shaded)	474
12.4	Dispersion diagram for light propagation along x-axis for various hole sizes	474
12.5	Band diagram calculated along the high-symmetry direction of the 2D photonic crystal	475
12.6	Band diagram calculated along the high-symmetry direction of 2D photonic crystal	476
12.7	Schematic diagram of planar photonic crystal	477
12.8	Drawings of various structures: (a) birefringent PCF; (b) ultra-small core PCF; (c) hollow core PCF; and (d) hollow core Bragg fibre. The white regions represent silica, the black regions are hollow, and the gray regions are other materials (glasses or polymers)	479
12.9	Microstructured optical fibres with air holes	479
12.10	Behaviour of glass core/air hole fibre	481
12.11	Behaviour of glass core/air hole fibre (d is the hole width and λ is the pitch)	481
12.12	Sketch of a typical density-of-photonic state (DOPS) diagram	483
12.13	Comparison of a PCF based supercontinuum source with a fibre coupled white light source	484
12.14	(a) Schematic of the SPP electromagnetic field at an interface defined by $z = 0$, and (b) the SPP field component $ E_z $ decays exponentially into both conductor ($z < 0$) and dielectric ($z > 0$) while propagating along the y-direction	487
12.15	Schematic of the geometry used for deriving the SPP electromagnetic field	488
12.16	Dispersion relation of SPP	489
12.17	Schematic of the geometry used for deriving the SPP in a two-interface system	490

12.18	General schematic of prism coupling of free electromagnetic waves to SPPs	492
12.19	Dispersion relation of SPP for prism coupling	492
12.20	The shifted dispersion relations (dashed lines) are depicted for three values of n	493

List of Tables

2.1	Ranges of electromagnetic spectrum	56
2.2	Differences between electromagnetic and optical waves . . .	64
10.1	Different values of diagonal preprocessor matrices and corresponding filters	377
10.2	Unconstrained linear filter designs	379
10.3	Some advanced correlation filters	380
11.1	Technologies for qubit realisation	440
