Preface to the First Edition

They throw geometry out the door, and it comes back through the window.

(H.G.Forder, Auckland 1973, reading new mathematics at the age of 84)

The subject of this book is numerical methods that preserve geometric properties of the flow of a differential equation: symplectic integrators for Hamiltonian systems, symmetric integrators for reversible systems, methods preserving first integrals and numerical methods on manifolds, including Lie group methods and integrators for constrained mechanical systems, and methods for problems with highly oscillatory solutions. Structure preservation – with its questions as to where, how, and what for – is the unifying theme.

In the last few decades, the theory of numerical methods for general (non-stiff and stiff) ordinary differential equations has reached a certain maturity, and excellent general-purpose codes, mainly based on Runge–Kutta methods or linear multistep methods, have become available. The motivation for developing structure-preserving algorithms for special classes of problems came independently from such different areas of research as astronomy, molecular dynamics, mechanics, theoretical physics, and numerical analysis as well as from other areas of both applied and pure mathematics. It turned out that the preservation of geometric properties of the flow not only produces an improved qualitative behaviour, but also allows for a more accurate long-time integration than with general-purpose methods.

An important shift of view-point came about by ceasing to concentrate on the numerical approximation of a single solution trajectory and instead to consider a numerical method as a *discrete dynamical system* which approximates the flow of the differential equation – and so the geometry of phase space comes back again through the window. This view allows a clear understanding of the preservation of invariants and of methods on manifolds, of symmetry and reversibility of methods, and of the symplecticity of methods and various generalizations. These subjects are presented in Chapters IV through VII of this book. Chapters I through III are of an introductory nature and present examples and numerical integrators together with important parts of the classical order theories and their recent extensions. Chapter VIII deals with questions of numerical implementations and numerical merits of the various methods.

It remains to explain the relationship between geometric properties of the numerical method and the favourable error propagation in long-time integrations. This

is done using the idea of *backward error analysis*, where the numerical one-step map is interpreted as (almost) the flow of a modified differential equation, which is constructed as an asymptotic series (Chapter IX). In this way, geometric properties of the numerical integrator translate into structure preservation on the level of the modified equations. Much insight and rigorous error estimates over long time intervals can then be obtained by combining this backward error analysis with KAM theory and related perturbation theories. This is explained in Chapters X through XII for Hamiltonian and reversible systems. The final Chapters XIII and XIV treat the numerical solution of differential equations with high-frequency oscillations and the long-time dynamics of multistep methods, respectively.

This book grew out of the lecture notes of a course given by Ernst Hairer at the University of Geneva during the academic year 1998/99. These lectures were directed at students in the third and fourth year. The reactions of students as well as of many colleagues, who obtained the notes from the Web, encouraged us to elaborate our ideas to produce the present monograph.

We want to thank all those who have helped and encouraged us to prepare this book. In particular, Martin Hairer for his valuable help in installing computers and his expertise in Latex and Postscript, Jeff Cash and Robert Chan for reading the whole text and correcting countless scientific obscurities and linguistic errors, Haruo Yoshida for making many valuable suggestions, Stéphane Cirilli for preparing the files for all the photographs, and Bernard Duzé, the irreplaceable director of the mathematics library in Geneva. We are also grateful to many friends and colleagues for reading parts of the manuscript and for valuable remarks and discussions, in particular to Assy Abdulle, Melanie Beck, Sergio Blanes, John Butcher, Mari Paz Calvo, Begoña Cano, Philippe Chartier, David Cohen, Peter Deuflhard, Stig Faltings, Francesco Fassò, Martin Gander, Marlis Hochbruck, Bulent Karasözen, Wilhelm Kaup, Ben Leimkuhler, Pierre Leone, Frank Loose, Katina Lorenz, Robert McLachlan, Ander Murua, Alexander Ostermann, Truong Linh Pham, Sebastian Reich, Chus Sanz-Serna, Zaijiu Shang, Yifa Tang, Matt West, Will Wright.

We are especially grateful to Thanh-Hà Lê Thi and Dr. Martin Peters from Springer-Verlag Heidelberg for assistance, in particular for their help in getting most of the original photographs from the Oberwolfach Archive and from Springer New York, and for clarifying doubts concerning the copyright.

Preface to the Second Edition

The fast development of the subject – and the fast development of the sales of the first edition of this book – has given the authors the opportunity to prepare this second edition. First of all we have corrected several misprints and minor errors which we have discovered or which have been kindly communicated to us by several readers and colleagues. We cordially thank all of them for their help and for their interest in our work. A major point of confusion has been revealed by Robert McLachlan in his book review in SIAM Reviews.

Besides many details, which have improved the presentation throughout the book, there are the following major additions and changes which make the book about 130 pages longer:

- a more prominent place of the Störmer–Verlet method in the exposition and the examples of the first chapter;
- a discussion of the Hénon–Heiles model as an example of a chaotic Hamiltonian system;
- a new Sect. IV.9 on geometric numerical linear algebra considering differential equations on Stiefel and Grassmann manifolds and dynamical low-rank approximations;
- a new improved composition method of order 10 in Sect. V.3;
- a characterization of B-series methods that conserve quadratic first integrals and a criterion for conjugate symplecticity in Sect. VI.8;
- the section on volume preservation taken from Chap. VII to Chap. VI;
- an extended and more coherent Chap. VII, renamed Non-Canonical Hamiltonian Systems, with more emphasis on the relationships between Hamiltonian systems on manifolds and Poisson systems;
- a completely reorganized and augmented Sect. VII.5 on the rigid body dynamics and Lie–Poisson systems;
- a new Sect. VII.6 on reduced Hamiltonian models of quantum dynamics and Poisson integrators for their numerical treatment;
- an improved step-size control for reversible methods in Sects. VIII.3.2 and IX.6;
- extension of Sect. IX.5 on modified equations of methods on manifolds to include constrained Hamiltonian systems and Lie–Poisson integrators;
- reorganization of Sects. IX.9 and IX.10; study of non-symplectic B-series methods that have a modified Hamiltonian, and counter-examples for symmetric methods showing linear growth in the energy error;

- a more precise discussion of integrable reversible systems with new examples in Chap. XI;
- extension of Chap. XIII on highly oscillatory problems to systems with several constant frequencies and to systems with non-constant mass matrix;
- a new Chap. XIV on oscillatory Hamiltonian systems with time- or solution-dependent high frequencies, emphasizing adiabatic transformations, adiabatic invariants, and adiabatic integrators;
- a completely rewritten Chap. XV with more emphasis on linear multistep methods for second order differential equations; a complete backward error analysis including parasitic modified differential equations; a study of the long-time stability and a rigorous explanation of the long-time near-conservation of energy and angular momentum.

Let us hope that this second revised edition will again meet good acceptance by our readers.

Geneva and Tübingen, October 2005

The Authors

Table of Contents

I.	Examples and Numerical Experiments	1
I.1	First Problems and Methods	1
I.1.1	The Lotka–Volterra Model	1
I.1.2	First Numerical Methods	3
I.1.3	The Pendulum as a Hamiltonian System	4
I.1.4	The Störmer–Verlet Scheme	7
I.2	The Kepler Problem and the Outer Solar System	8
I.2.1	Angular Momentum and Kepler's Second Law	9
I.2.2	Exact Integration of the Kepler Problem	10
I.2.3	Numerical Integration of the Kepler Problem	12
I.2.4	The Outer Solar System	13
I.3	The Hénon–Heiles Model	15
I.4	Molecular Dynamics	18
I.5	Highly Oscillatory Problems	21
I.5.1	A Fermi–Pasta–Ulam Problem	21
I.5.2	Application of Classical Integrators	23
I.6	Exercises	24
II.	Numerical Integrators	27
II.1	Runge–Kutta and Collocation Methods	27
II.1.1	Runge–Kutta Methods	28
II.1.2	Collocation Methods	30
II.1.3	Gauss and Lobatto Collocation	34
II.1.4	Discontinuous Collocation Methods	35
II.2	Partitioned Runge–Kutta Methods	38
II.2.1	Definition and First Examples	38
II.2.2	Lobatto IIIA–IIIB Pairs	40
II.2.3	Nyström Methods	41
II.3	The Adjoint of a Method	42
II.4	Composition Methods	43
II.5	Splitting Methods	47
II.6	Exercises	50

III.	Order Conditions, Trees and B-Series	51
III.1	Runge–Kutta Order Conditions and B-Series	51
III.1.1	Derivation of the Order Conditions	51
III.1.2	B-Series	56
III.1.3	Composition of Methods	59
III.1.4	Composition of B-Series	61
III.1.5	The Butcher Group	64
III.2	Order Conditions for Partitioned Runge–Kutta Methods	66
III.2.1	Bi-Coloured Trees and P-Series	66
III.2.2	Order Conditions for Partitioned Runge–Kutta Methods	68
III.2.3	Order Conditions for Nyström Methods	69
III.3	Order Conditions for Composition Methods	71
III.3.1	Introduction	71
III.3.2	The General Case	73
III.3.3	Reduction of the Order Conditions	75
III.3.4	Order Conditions for Splitting Methods	80
III.4	The Baker–Campbell–Hausdorff Formula	83
III.4.1	Derivative of the Exponential and Its Inverse	83
III.4.2	The BCH Formula	84
III.5	Order Conditions via the BCH Formula	87
III.5.1	Calculus of Lie Derivatives	87
III.5.2	Lie Brackets and Commutativity	89
III.5.3	Splitting Methods	91
III.5.4	Composition Methods	92
III.6	Exercises	95
IV.	Conservation of First Integrals and Methods on Manifolds	97
IV.1	Examples of First Integrals	97
IV.2	Quadratic Invariants	101
IV.2.1	Runge–Kutta Methods	101
IV.2.2	Partitioned Runge–Kutta Methods	102
IV.2.3	Nyström Methods	104
IV.3	Polynomial Invariants	105
IV.3.1	The Determinant as a First Integral	105
IV.3.2	Isospectral Flows	107
IV.4	Projection Methods	109
IV.5	Numerical Methods Based on Local Coordinates	113
IV.5.1	Manifolds and the Tangent Space	114
IV.5.2	Differential Equations on Manifolds	115
IV.5.3	Numerical Integrators on Manifolds	116
IV.6	Differential Equations on Lie Groups	118
IV.7	Methods Based on the Magnus Series Expansion	121
IV.8	Lie Group Methods	123
IV.8.1	Crouch–Grossman Methods	124
IV.8.2	Munthe–Kaas Methods	125

IV.8.3	Further Coordinate Mappings	128
IV.9	Geometric Numerical Integration Meets Geometric Numerical Linear Algebra	131
IV.9.1	Numerical Integration on the Stiefel Manifold	131
IV.9.2	Differential Equations on the Grassmann Manifold	135
IV.9.3	Dynamical Low-Rank Approximation	137
IV.10	Exercises	139
V.	Symmetric Integration and Reversibility	143
V.1	Reversible Differential Equations and Maps	143
V.2	Symmetric Runge–Kutta Methods	146
V.2.1	Collocation and Runge–Kutta Methods	146
V.2.2	Partitioned Runge–Kutta Methods	148
V.3	Symmetric Composition Methods	149
V.3.1	Symmetric Composition of First Order Methods	150
V.3.2	Symmetric Composition of Symmetric Methods	154
V.3.3	Effective Order and Processing Methods	158
V.4	Symmetric Methods on Manifolds	161

XV.2.2	Formal Analysis for Weakly Stable Methods	575
XV.3	Backward Error Analysis	576
XV.3.1	Modified Equation for Smooth Numerical Solutions . . .	576
XV.3.2	Parasitic Modified Equations	579
XV.4	Can Multistep Methods be Symplectic?	585
XV.4.1	Non-Symplecticity of the Underlying One-Step Method .	585
XV.4.2	Symplecticity in the Higher-Dimensional Phase Space .	587
XV.4.3	Modified Hamiltonian of Multistep Methods	589
XV.4.4	Modified Quadratic First Integrals	591
XV.5	Long-Term Stability	592
XV.5.1	Role of Growth Parameters	592
XV.5.2	Hamiltonian of the Full Modified System	594
XV.5.3	Long-Time Bounds for Parasitic Solution Components	596
XV.6	Explanation of the Long-Time Behaviour	600
XV.6.1	Conservation of Energy and Angular Momentum	600
XV.6.2	Linear Error Growth for Integrable Systems	601
XV.7	Practical Considerations	602
XV.7.1	Numerical Instabilities and Resonances	602
XV.7.2	Extension to Variable Step Sizes	605
