Foreword

More than a generation of German-speaking students around the world have worked their way to an understanding and appreciation of the power and beauty of modern theoretical physics—with mathematics, the most fundamental of sciences—using Walter Greiner's textbooks as their guide.

The idea of developing a coherent, complete presentation of an entire field of science in a series of closely related textbooks is not a new one. Many older physicians remember with real pleasure their sense of adventure and discovery as they worked their ways through the classic series by Sommerfeld, by Planck, and by Landau and Lifshitz. From the students' viewpoint, there are a great many obvious advantages to be gained through the use of consistent notation, logical ordering of topics, and coherence of presentation; beyond this, the complete coverage of the science provides a unique opportunity for the author to convey his personal enthusiasm and love for his subject.

These volumes on classical physics, finally available in English, complement Greiner's texts on quantum physics, most of which have been available to English-speaking audiences for some time. The complete set of books will thus provide a coherent view of physics that includes, in classical physics, thermodynamics and statistical mechanics, classical dynamics, electromagnetism, and general relativity; and in quantum physics, quantum mechanics, symmetries, relativistic quantum mechanics, quantum electro- and chromodynamics, and the gauge theory of weak interactions.

What makes Greiner's volumes of particular value to the student and professor alike is their completeness. Greiner avoids the all too common "it follows that . . .," which conceals several pages of mathematical manipulation and confounds the student. He does not hesitate to include experimental data to illuminate or illustrate a theoretical point, and these data, like the theoretical content, have been kept up to date and topical through frequent revision and expansion of the lecture notes upon which these volumes are based.

Moreover, Greiner greatly increases the value of his presentation by including something like one hundred completely worked examples in each volume. Nothing is of greater importance to the student than seeing, in detail, how the theoretical concepts and tools

under study are applied to actual problems of interest to working physicists. And, finally, Greiner adds brief biographical sketches to each chapter covering the people responsible for the development of the theoretical ideas and/or the experimental data presented. It was Auguste Comte (1789–1857) in his *Positive Philosophy* who noted, “To understand a science it is necessary to know its history.” This is all too often forgotten in modern physics teaching, and the bridges that Greiner builds to the pioneering figures of our science upon whose work we build are welcome ones.

Greiner’s lectures, which underlie these volumes, are internationally noted for their clarity, for their completeness, and for the effort that he has devoted to making physics an integral whole. His enthusiasm for his sciences is contagious and shines through almost every page.

These volumes represent only a part of a unique and Herculean effort to make all of theoretical physics accessible to the interested student. Beyond that, they are of enormous value to the professional physicist and to all others working with quantum phenomena. Again and again, the reader will find that, after dipping into a particular volume to review a specific topic, he or she will end up browsing, caught up by often fascinating new insights and developments with which he or she had not previously been familiar.

Having used a number of Greiner’s volumes in their original German in my teaching and research at Yale, I welcome these new and revised English translations and would recommend them enthusiastically to anyone searching for a coherent overview of physics.

New Haven, Connecticut, USA

Preface

Theoretical physics has become a many faceted science. For the young student, it is difficult enough to cope with the overwhelming amount of new material that has to be learned, let alone obtain an overview of the entire field, which ranges from mechanics through electrodynamics, quantum mechanics, field theory, nuclear and heavy-ion science, statistical mechanics, thermodynamics, and solid-state theory to elementary-particle physics; and this knowledge should be acquired in just eight to ten semesters, during which, in addition, a diploma or master's thesis has to be worked on or examinations prepared for. All this can be achieved only if the university teachers help to introduce the student to the new disciplines as early as possible, in order to create interest and excitement that in turn set free essential new energy.

At the Johann Wolfgang Goethe University in Frankfurt am Main, we therefore confront the student with theoretical physics immediately, in the first semester. Theoretical Mechanics I and II, Electrodynamics, and Quantum Mechanics I—An Introduction are the courses during the first two years. These lectures are supplemented with many mathematical explanations and much support material. After the fourth semester of studies, graduate work begins, and Quantum Mechanics II—Symmetries, Statistical Mechanics and Thermodynamics, Relativistic Quantum Mechanics, Quantum Electrodynamics, Gauge Theory of Weak Interactions, and Quantum Chromodynamics are obligatory. Apart from these, a number of supplementary courses on special topics are offered, such as Hydrodynamics, Classical Field Theory, Special and General Relativity, Many-Body Theories, Nuclear Models, Models of Elementary Particles, and Solid-State Theory.

This volume of lectures, *Classical Mechanics: Point Particles and Relativity*, deals with the first and more elementary part of the important field of classical mechanics. We have tried to present the subject in a manner that is both interesting to the student and easily accessible. The main text is therefore accompanied by many exercises and examples that have been worked out in great detail. This should make the book useful also for students wishing to study the subject on their own.

Beginning the education in theoretical physics at the first university semester, and not as dictated by tradition after the first one and a half years in the third or fourth semester, has brought along quite a few changes as compared to the traditional courses in that discipline.

Especially necessary is a greater amalgamation between the actual physical problems and the necessary mathematics. Therefore, we treat in the first semester vector algebra and analysis, the solution of ordinary, linear differential equations, Newton's mechanics of a mass point culminating in the discussion of Kepler's laws (planetary motion), elements of astronomy, addressing modern research issues like the dark matter problem, and the mathematically simple mechanics of special relativity.

Many explicitly worked-out examples and exercises illustrate the new concepts and methods and deepen the interrelationship between physics and mathematics. As a matter of fact, this first-semester course in theoretical mechanics is a precursor to theoretical physics. This changes significantly the content of the lectures of the second semester addressed in the volume *Classical Mechanics: System of Particles and Hamiltonian Dynamics*.

The new mathematical tools are explained and exercised in many physical examples. In the lecturing praxis, the deepening of the exhibited material is carried out in a three-hour-per-week *theoretica*, that is, group exercises where eight or ten students solve the given exercises under the guidance of a tutor.

Biographical and historical footnotes anchor the scientific development within the general context of scientific progress and evolution. In this context, I thank the publishers Harri Deutsch and F. A. Brockhaus (*Brockhaus Enzyklopädie*, F.A. Brockhaus, Wiesbaden—marked by [BR]) for giving permission to extract the biographical data of physicists and mathematicians from their publications.

We should also mention that in preparing some early sections and exercises of our lectures we relied on the book *Theory and Problems of Theoretical Mechanics*, by Murray R. Spiegel, McGraw-Hill, New York, 1967.

Over the years, we enjoyed the help of several students and collaborators, in particular, H. Angermüller, P. Bergmann, H. Betz, W. Betz, G. Binnig (Nobel prize 1986), J. Briechle, M. Bundschuh, W. Caspar, C. v. Charewski, J. v. Czarnecki, R. Fickler, R. Fiedler, B. Fricke (now professor at Kassel University), C. Greiner (now professor at JWG-University, Frankfurt am Main), M. Greiner, W. Grosch, R. Heuer, E. Hoffmann, L. Kohaupt, N. Krug, P. Kurowski, H. Leber, H. J. Lustig, A. Mahn, B. Moreth, R. Mörschel, B. Müller (now professor at Duke University, Durham, N.C.), H. Müller, H. Peitz, J. Rafelski (now professor at University of Arizona, Tuscon), G. Plunien, J. Reinhardt, M. Rufa, H. Schaller, D. Schebesta, H. J. Scheefer, H. Schwerin, M. Seiwert, G. Soff (now professor at Technical University Dresden), M. Soffel (now professor at Technical University Dresden), E. Stein (now professor at Maharishi University, Vlodrop, Netherlands), K. E. Stiebig, E. Stämmeler, H. Stock, H. Störmer (Nobel prize 1998), J. Wagner, and R. Zimmermann. They all made their way in science and society, and meanwhile work as professors at universities, as leaders in industry, and in other places. We particularly acknowledge the recent help of Dr. Sven Soff and Dr. Stefan Scherer during the preparation of the English manuscript. The figures were drawn by Mrs. A. Steidl.

The English manuscript was copy-edited by Kristen Cassereau and the production of the book was supervised by Timothy Taylor of Springer-Verlag New York, Inc.

Preface	vii
I VECTOR CALCULUS	1
1 Introduction and Basic Definitions	2
2 The Scalar Product	5
3 Component Representation of a Vector	9
4 The Vector Product (Axial Vector)	13
5 The Triple Scalar Product	25
6 Application of Vector Calculus	27
Application in mathematics:	27
Application in physics:	31
7 Differentiation and Integration of Vectors	39
8 The Moving Trihedral (Accompanying Dreibein)—the Frenet Formulas	49
Examples on Frenet's formulas:	55
	ix

9 Surfaces in Space	64
10 Coordinate Frames	68
11 Vector Differential Operations	83
The operations gradient, divergence, and curl (rotation)	83
Differential operators in arbitrary general (curvilinear) coordinates	96
12 Determination of Line Integrals	109
13 The Integral Laws of Gauss and Stokes	112
Gauss Law:	112
The Gauss theorem:	114
Geometric interpretation of the Gauss theorem:	115
Stokes law:	117
14 Calculation of Surface Integrals	125
15 Volume (Space) Integrals	130
 II NEWTONIAN MECHANICS	 133
16 Newton's Axioms	134
17 Basic Concepts of Mechanics	140
Inertial systems	140
Measurement of masses	141
Work	141
Kinetic energy	142
Conservative forces	142
Potential	143
Energy law	144
Equivalence of impulse of force and momentum change	144
Angular momentum and torque	149
Conservation law of angular momentum	150
Law of conservation of the linear momentum	150
Summary	150
The law of areas	151
Conservation of orientation	151

18 The General Linear Motion	159
19 The Free Fall	163
Vertical throw	164
Inclined throw	166
20 Friction	172
Friction phenomena in a viscous medium	172
Motion in a viscous medium with Newtonian friction	177
Generalized <i>ansatz</i> for friction:	179
21 The Harmonic Oscillator	196
22 Mathematical Interlude—Series Expansion, Euler's Formulas	210
23 The Damped Harmonic Oscillator	214
24 The Pendulum	229
25 Mathematical Interlude: Differential Equations	241
26 Planetary Motions	246
27 Special Problems in Central Fields	282
The gravitational field of extended bodies	282
The attractive force of a spherical mass shell	283
The gravitational potential of a spherical shell covered with mass	285
Stability of circular orbits	289
28 The Earth and our Solar System	295
General notions of astronomy	295
Determination of astronomic quantities	296
Properties, position, and evolution of the solar system	308
World views	315
On the evolution of the universe	325
Dark Matter	330
What is the nature of the dark matter?	338

III	THEORY OF RELATIVITY	361
29	Relativity Principle and Michelson–Morley Experiment	362
	The Michelson–Morley experiment	364
30	The Lorentz Transformation	370
	Rotation of a three-dimensional coordinate frame	372
	The Minkowski space	374
	Group property of the Lorentz transformation	383
31	Properties of the Lorentz transformation	389
	Time dilatation	389
	Lorentz–Fitzgerald length contraction	394
	Note on the invisibility of the Lorentz–Fitzgerald length contraction	396
	The visible appearance of quickly moving bodies	398
	Optical appearance of a quickly moving cube	398
	Optical appearance of bodies moving with almost the speed of light	400
	Light intensity distribution of a moving isotropic emitter	404
	Doppler shift of quickly moving bodies	407
	Relativistic space-time structure—space-time events	412
	Relativistic past, present, future	413
	The causality principle	414
	The Lorentz transformation in the two-dimensional subspace of the Minkowski space	415
32	Addition Theorem of the Velocities	419
	Supervelocity of light, phase, and group velocity	421

33 The Basic Quantities of Mechanics in Minkowski Space	425
Lorentz scalars	426
Four-velocity in Minkowski space	427
Momentum in Minkowski space	428
Minkowski force (four-force)	428
Kinetic energy	433
The Tachyon hypothesis	442
Derivation of the energy law in the Minkowski space	444
The fourth momentum component	445
Conservation of momentum and energy for a free particle	446
Relativistic energy for free particles	446
Examples on the equivalence of mass and energy	448
34 Applications of the Special Theory of Relativity	461
The elastic collision	461
Compton scattering	465
The inelastic collision	468
Decay of an unstable particle	470
Index	485

Examples

3.1	Addition and subtraction of vectors	11
4.1	Vector product	19
4.2	Proof of theorems on determinants	20
4.3	Determinants	22
4.4	Laplace expansion theorem	22
6.1	Distance vector	27
6.2	Projection of a vector onto another vector	27
6.3	Equations of a straight line and of a plane	28
6.4	The cosine theorem	28
6.5	The theorem of Thales	29
6.6	The rotation matrix	29
6.7	Superposition of forces	31
6.8	Equilibrium condition for a rigid body without fixed rotational axis	32
6.9	Force and torque	34
6.10	Forces in a three-leg stand	35
6.11	Total force and torque	37
7.1	Differentiation of a vector	40
7.2	Differentiation of the product of a scalar and a vector	41
7.3	Velocity and acceleration on a space curve	42
7.4	Circular motion	43
7.5	The motion on a helix	44
7.6	Integration of a vector	45
7.7	Integration of a vector	45
7.8	Motion on a special space curve	46
7.9	Airplane landing along a special space curve	47
8.1	Curvature and torsion	55
8.2	Frenet's formulas for the circle	55
8.3	Moving trihedral and helix	57
8.4	Evolute of a circle	61

8.5	Arc length	61
8.6	Generalization of the Evolute	62
9.1	Normal vector of a surface in space	66
10.1	Velocity and acceleration in cylindrical coordinates	78
10.2	Representation of a vector in cylindrical coordinates	80
10.3	Angular velocity and radial acceleration	81
11.1	Gradient of a scalar field	91
11.2	Determination of the scalar field from the associated gradient field	91
11.3	Divergence of a vector field	91
11.4	Rotation of a vector field	92
11.5	Electric field strength, electric potential	92
11.6	Differential operations in spherical coordinates	93
11.7	Reciprocal trihedral	98
11.8	Reciprocal coordinate frames	99
12.1	Line integral over a vector field	111
13.1	Path independence of a line integral	118
13.2	Determination of the potential function	121
13.3	Vortex flow of a force field through a half-sphere	121
13.4	On the conservative force field	123
14.1	On the calculation of a surface integral	126
14.2	Flow through a surface	127
15.1	Calculation of a volume integral	131
15.2	Calculation of a total force from the force density	132
16.1	Single-rope pulley	137
16.2	Double-rope pulley	137
17.1	Potential energy	143
17.2	Impulse of momentum by a time-dependent force field	145
17.3	Impulse of force	146
17.4	The ballistic pendulum	147
17.5	Forces in the motion on an ellipse	151
17.6	Calculation of angular momentum and torque	153
17.7	Show that the given force field is conservative	154
17.8	Force field, potential, total energy	155
17.9	Momentum and force at a ram pile	155
17.10	Elementary considerations on fictitious forces	156
19.1	Motion of a mass in a constant force field	168
19.2	Motion on a helix in the gravitational field	168
19.3	Spaceship orbits around the earth	171
20.1	Free fall with friction according to Stokes	173

20.2	The inclined throw with friction according to Stokes	175
20.3	Free fall with Newtonian friction	181
20.4	Motion of an engine with friction	184
20.5	The inclined plane	185
20.6	Two masses on inclined planes	187
20.7	A chain slides down from a table	188
20.8	A disk on ice—the friction coefficient	190
20.9	A car accident	191
20.10	A particle on a sphere	192
20.11	A ladder leans at a wall	194
20.12	A mass slides under static and dynamic friction	195
21.1	Amplitude, frequency and period of a harmonic vibration	204
21.2	Mass hanging on a spring	204
21.3	Vibration of a mass at a displaced spring	205
21.4	Vibration of a swimming cylinder	205
21.5	Vibrating mass hanging on two strings	206
21.6	Composite springs	208
21.7	Vibration of a rod with pivot bearing	209
22.1	Various Taylor series	212
23.1	Damped vibration of a particle	223
23.2	The externally excited harmonic oscillator	225
23.3	Mass point in the x, y -plane	226
24.1	The cycloid	234
24.2	The cycloid pendulum	234
24.3	A pearl slides on a cycloid	236
24.4	The search for the tautochrone	237
26.1	The Cavendish experiment	253
26.2	Force law of a circular path	266
26.3	Force law of a particle on a spiral orbit	267
26.4	The lemniscate orbit	267
26.5	Escape velocity from earth	268
