FOREWORD

No systematized presentation of the pathology of the eye existed in any language until 1808 when James Wardrop, a Scotsman then aged 26, published his first edition of *Essays on the Morbid Anatomy of the Human Eye*, followed the next year by *Fungus Haematodes or Soft Cancer* which established retinoblastoma as a recognized entity. Although these books were not the first to describe or illustrate specimens of ocular disease, and in fact contained little morbid anatomy as now defined, they introduced, by dissections and macroscopical studies, an area of investigation eventually to become the specialty of ophthalmic pathology.

The subsequent development of microscopy in the late nineteenth century and early twentieth century and its wider use throughout all aspects of laboratory science led to an immense and still expanding increase in knowledge. The revelations of histology and histopathology had as dramatic an impact as those of electron microscopy in modern times, and ophthalmic pathology in its turn became largely concerned with the documentation of macroscopical and microscopical features of diseased ocular tissues. There followed many textbooks dealing exclusively or predominantly with these aspects; the most widely admired are beautifully illustrated first with superb paintings and drawings and later by photographic reproductions, which in the last two decades reached the highest quality. These remain classic textbooks in ophthalmology and are of inestimable value, but curiously ophthalmic pathology continued to be confined to morbid anatomy long after pathology itself had branched out to found the present main disciplines of histopathology, chemical pathology, hematology, medical microbiology, and immunopathology. Even today ophthalmic pathology is usually equated with histopathology of the eye; that is certainly the main interest of American, Canadian, and European ophthalmic pathology societies. This has been at least partly due to the fact that for many years ophthalmic pathology was a part-time pursuit of ophthalmologists engaged in exacting clinical practice, and perhaps it would be as reasonable to expect them to have had the time to become conversant with the many developments in pathology as it would be to expect a general pathologist to be skilled, for instance, in the latest methods of cataract extraction or the management of glaucoma. Thus while freely acknowledging that the present sum of knowledge in ophthalmic pathology is much indebted to them, I have always been convinced that future progress must be more widely based. In 1957 I wrote

If in the future, eye pathology is to be taught and practised in the traditional way, as an elaborate recording of histologic minutiae, then the subject is not too demanding and may well be undertaken as a part-time pursuit, and probably best by the ophthalmologist who is most able to extract the greatest clinical value from the findings. But if the study of ocular pathology is to have its full meaning, the eye must be regarded as a unit of an entire organism, and its behavior in disease must as far as possible be related to that of the whole. Research in this field, in common with the general tendency, should concern itself with disease mechanisms rather than with disease patterns, and for this purpose the widest possible knowledge of pathologic

processes is desirable and the whole armamentarium of modern scientific method should be available. To establish ocular pathology on this broad basis will demand the full and concentrated attention of workers trained and experienced in the appropriate disciplines.*

Nearly a quarter of a century later I have nothing to add to these convictions and I warmly welcome this monumental work in two volumes planned and executed on the lines I had so hopefully visualized, and I am proud that such a notable work should have been assembled by Professor Alec Garner, my successor as director of the Department of Pathology at the Institute of Ophthalmology in London, and Professor Gordon Klintworth some-time visiting professor there. With their able collaborators they present in these comprehensive volumes exactly the approach to ocular disease that is essential both for its immediate elucidation and for the whole future development of the subject, not in isolation but within the context of pathology as a whole.

With this conviction I warmly commend this book to everyone interested and involved in this fascinating field of learning, and wish all those concerned in its production the success so richly deserved.

Norman Ashton

Emeritus Professor of Pathology

University of London and

The Royal College of Surgeons of England

**Am. J. Ophthalmol.* 44:5-6, 1957.

PREFACE

Such is the volume of ophthalmologic and pathological writing that only by stepping aside completely from one's commitment to engage actively in these disciplines would it be possible to absorb all that might profitably be read. It would be irresponsible of any potential author or editor to unleash on the busy student yet more reading matter should it not fill a real need. There are in existence already several excellent treatises relating to the pathological anatomy of the eye, and it would have been redundant for us to seek to emulate them; rather we have sought to direct attention to dynamic considerations and disease mechanisms, and so complement the emphasis on descriptive pathology to be found in other writings on the subject. Hence the title *Pathobiology of Ocular Disease: A Dynamic Approach*.

It is our belief that knowing the appearance of a lesion and being able to recognize it is only the beginning of the story. If appropriate and rational treatment is to be instituted, it is also necessary to understand what is happening and, where possible, why. For instance, from the practicing clinician's standpoint, more important than to recognize granulomatous inflammation when seen in a microscopical preparation is to have some idea of what that means in terms of causative factors and likely behavior. That is not to say we decry descriptive pathology—far from it, for morphology and function are but the two sides of the same coin and are patently interdependent. But the job of the pathologist is both to identify disease processes and to interpret them in behavioral terms. It was with this dual role of pathology in mind that we invited the various contributors to compose their chapters.

However, success is an elusive goal when the brief is so demanding. To state what and where is one thing; to ask how and why is quite another. Nevertheless, as editors, we feel that our contributors have responded magnificently and it is our fervent hope that the result will meet the needs of serious students of ophthalmology, be they trainees or more experienced practitioners, who are keen to understand the nature of the disorders they are called on to treat. The emphasis on dynamic disease processes inevitably encompasses the whole gamut of pathological disciplines—microbiology, immunology, and biochemistry, as well as histopathology, and this all-embracing interpretation of pathology serves further to distinguish our book from existing texts.

For a variety of reasons, which need not be spelt out here, ophthalmic pathology is commonly viewed with suspicion by other pathologists. Trained as general pathologists ourselves, we as editors hope that, by relating the specific matters of ocular pathology to the basic and more general aspects of disease processes, we will have gone some way towards persuading our colleagues that study of the eye is both fascinating and rewarding.

Inevitably, to assemble a multiauthor compendium of the sort we have compiled, such that there is not too much diversity of approach, has involved a great deal of effort, not only for the editors, but also for the gallant contributors who have had to contend with a seemingly endless stream of queries and comment. We want to thank them for their cooperation and forbearance.

Other people whose assistance has been invaluable are acknowledged elsewhere but we would also put on record our appreciation of the unstinting advice and practical help provided by the staff of

our publisher, Marcel Dekker, Inc. and of the colossal support we have received from our secretaries, Catherine Thornton, Pat Goodwin, Louise Hart, Frances Slocum, Candiss Weaver, Pat Burks, Bonnie Lynch, Diane Evans, Linda Brogan, Marge Penny, and Virginia Hotelling. Lastly, if for no other reason than that they are the ones who at the end of the day have had to bear with us when the task of preparing the book weighed overheavily on our shoulders, we want to thank our wives and children for their tolerance and encouragement.

Alec Garner
Gordon K. Klintworth

ACKNOWLEDGMENTS

This book would not have been possible without the assistance of many individuals. Aside from the vital role of the authors and the editorial staff of Marcel Dekker, Inc., numerous individuals provided critical reviews of chapters. In this regard, we wish to thank the following:

Mathea R. Allansmith	Doyle G. Graham
Douglas R. Anderson	Donald D. Hackel
Norman Ashton	Hal K. Hawkins
Elaine R. Berman	Hannah Kinney
Stanley Braverman	Jim H. Kinoshita
Robert P. Burns	John F. R. Kuck, Jr.
R. Jean Campbell	Robert Machemer
Leo T. Chylack	Kenneth S. McCarty, Jr.
David G. Cogan	Don Minckler
Byron P. Croker, Jr.	Ralph Muller
Anthony J. Dark	G. Richard O'Connor
D. Doniach	M. Bruce Shields
Roberta Meyers Elliot	James Tiedeman
Bernard F. Fetter	Robert Trelstad
Ben S. Fine	F. Stephen Vogel
Ramon L. Font	Lorenz E. Zimmerman
Robert Y. Foos	

Allan Summers, Susan Feinglos, Ginger Reeves, Betty Adams, Mary Ann Brown, and Janet Shields were most helpful in checking and completing the innumerable references.

The following assisted authors with specific chapters: Nancy L. Robinson, Glenn P. Kimball, and Karen A. Pelletier (Chapters 20 and 25), David Andrews (Chapter 23), Joseph Hackett (Chapter 42).

Contents of Part B	xvii	

BASIC PRINCIPLES

1 Ultrastructural Alterations in Pathologic States	3
<i>John D. Shelburne</i>	
Introduction / Techniques of electron microscopy / Ultrastructural pathology	
References	
2 Inflammation	59
<i>Dolph O. Adams and Stephen R. Turner</i>	
Introduction / Inflammatory mediators / Leukocytes / Acute inflammation	
Chronic inflammation / Granulomatous inflammation / Wound healing	
Postlude / References	

IMMUNOLOGICAL PRINCIPLES

3 Immunological Processes in Disease: General Principles	93
<i>Amjad H. S. Rahi</i>	
Lymphoid system / Antigen, adjuvant, and immunoglobulins / Cellular cooperation and regulation of antibody response / Cell-mediated immune response / Pathological immune mechanisms / Immunological tolerance / Autoimmunity / Principles of immunological methods / References	

4	Specific Ocular Manifestations of Immunological Processes	<i>Alec Garner</i>	139
	Introduction / Cornea / Lens / Conjunctiva / Uvea / Retina References		
5	Ocular Manifestations of Immune Disease	<i>Mitchell H. Friedlaender and Mathea R. Allansmith</i>	145
	Introduction / Vernal keratoconjunctivitis / Hay fever / Drug allergy Atopic dermatitis / Contact dermatitis / Pemphigus / Cicatricial pemphigoid Dermatitis herpetiformis / Erythema multiforme / Erythema nodosum Phlyctenulosis / Corneal transplantation / Chronic cyclitis / Fuchs' heterochromic iridocyclitis / Sympathetic ophthalmitis (sympathetic ophthalmia) / Vogt-Koyanagi-Harada syndrome / Lens-induced uveitis References		
6	Ocular Involvement in Systemic Immune Disorders	<i>Paul Henkind and Laura E. Fox</i>	187
	Introduction / Adult rheumatoid arthritis / Juvenile rheumatoid arthritis Ankylosing spondylitis / Reiter's disease / Sjögren's syndrome / Systemic lupus erythematosus / Systemic sclerosis (scleroderma) / Polyarteritis nodosa (periarteritis nodosa) / Wegener's granulomatosis / Giant-cell arteritis (temporal arteritis, cranial arteritis) / Relapsing polychondritis / Sarcoidosis / Behçet's disease / References		

INFECTION

7	Introduction to Ocular Infection	<i>Louis A. Wilson</i>	237
	Introduction / Organisms causing ocular disease / Mechanisms of pathogenicity Ocular responses to infection / Principles of laboratory investigation in ocular infection / References		
8	Viral and Rickettsial Infections	<i>Charles A. Daniels</i>	249
	General aspects of viral infections / Viral diseases affecting ocular structures General aspects of rickettsial infections / Rickettsial diseases affecting ocular structures / References		
9	Chlamydial Infections	<i>Sohrab Darougar and John D. Treharne</i>	281
	Introduction / Morphology and life cycle / Host-parasite relationship Clinical features / <i>Color plates 1 and 2</i> / Laboratory diagnosis / Treatment References		

10	Ocular Diseases Due to Bacteria	<i>Louis A. Wilson</i>	293
	Introduction / Mechanisms of pathogenicity / Gram-positive cocci Gram-positive rods / Gram-positive filaments / Gram-negative cocci Gram-negative diplobacilli / Gram-negative rods / Miscellaneous gram-negative bacteria / Acid-fast bacilli / Spirochetes / Mycoplasma References		
11	Fungus Infections of the Eye and Periocular Tissues		311
	<i>John V. Thomas and W. Richard Green</i>		
	Introduction / Fungal infections in specific sites / References		
12	Protozoal Infections	<i>G. Richard O'Connor</i>	345
	Introduction / Toxoplasmosis / Leishmaniasis / Trypanosomiasis Amoebiasis / Nosematosis / References		
13	Ocular Diseases Due to Helminths	<i>Alec Garner</i>	359
	General considerations / Immunology / Helminthic diseases of ophthalmic importance / References		
14	Ocular Diseases Due to Arthropods	<i>Alec Garner</i>	389
	Flies (diptera) / Lice / Arachnida / Other arthropods / References		

TRAUMA

15	Ocular Trauma	<i>Donald A. Morris</i>	397
	Introduction / Physical trauma / Thermal injuries / Chemical injuries Electrical injuries / Ultrasonic injuries / Radiational injuries / References		

CONGENITAL DEFECTS

16	Normal Development and Developmental Anomalies of the Eye	<i>Joan Mullaney</i>	443
	Introduction / Development of the normal eye / Teratogenic agents Development and developmental anomalies of multiple ocular structures Development and developmental anomalies of specific ocular structures References		

GLAUCOMA

- 17 Anterior Segment Changes in Glaucoma** 525
William R. Lee and Ian Grierson
Introduction / Classification of glaucoma / Effects of raised intraocular pressure on the tissues of the anterior segment / References
- 18 Posterior Segment Changes in Glaucoma** 553
Douglas R. Anderson
Pertinent features of normal anatomy and physiology / Pathophysiology: The effects of pressure / Acute glaucoma / Chronic glaucoma / References
- 19 The Metabolic Background in Glaucoma** 569
Anthony F. Winder
Introduction / Glaucoma and diabetes mellitus / Influence of corticosteroids
Role of glycosaminoglycans / Hemodynamic influences / Thyroid status
Postlude / References

TUMORS

- 20 Tumors: Nature and Biology** 579
Daniel M. Albert
Introduction / Causation of neoplasia / General remarks on the phakomatoses
References
- 21 Tumors of the Eyelids, Conjunctiva, and Cornea** 601
R. Jean Campbell
Introduction / Tumors and related lesions of the eyelids / Tumors, cysts, and related lesions of the conjunctiva / Tumors of the cornea and its adjacent structures
