# 致读者

**大口** 果你希望读到地道的英语,在享受英语阅读乐趣的同时又能增长知识、开拓视野,这套由外语教学与研究出版社与美国国家地理学会合作出版的"国家地理科学探索丛书"正是你的选择。

"国家地理科学探索丛书"分为9个系列,内容涉及自然科学和社会研究,秉承《国家地理》杂志图文并茂的特色,书中配有大量精彩的图片,文字通俗易懂、深入浅出,将科学性和趣味性完美结合,称得上是一套精致的小百科。

这套丛书以英文注释形式出版,注释由国内重点中学教学经验丰富的英语教师完成。特别值得推荐的是本套丛书在提高青少年读者英语阅读能力的同时,还注重培养他们的科学探索精神、动手能力、逻辑思维能力和沟通能力。

本丛书既适合学生自学,又可用于课堂教学。丛书各个系列均配有一本教师用书,内容包括背景知识介绍、技能训练提示、评估测试、多项选择题及答案等详尽的教学指导,是对课堂教学的极好补充。

本套丛书是适合中学生及英语爱好者的知识读物。

ince Dutch<sup>1</sup> explorers<sup>2</sup> first saw the moai in 1772, the world has marveled<sup>3</sup> at the huge statues. How were they moved to their positions<sup>4</sup> near the ocean? In 1955 a scientist named Thor Heyerdahl tried to find out.

Heyerdahl lived with the Rapa Nui<sup>5</sup> people of Easter Island, and eventually<sup>6</sup> the islanders<sup>7</sup> revealed<sup>8</sup> the secret of the moai. They said the statues had been raised using rocks and long wooden poles<sup>9</sup> cut from tree trunks<sup>10</sup>. The islanders showed Heyerdahl how a statue could be raised using ropes and two wooden poles as simple machines<sup>11</sup> called levers<sup>12</sup>. Each time the crew<sup>13</sup> raised the statue a little, they piled<sup>14</sup> rocks underneath<sup>15</sup> to hold it up. After 18 days, the 12 islanders had the statue standing up straight<sup>16</sup>.

In this book we'll look at how simple machines were used in the past and how we use them often in our lives today.

1.	Dutch	adj.	荷兰的
2.	explorer	n.	探险者: 探索者
3.	marvel	v.	惊奇
4.	position	n.	位置
5.	Rapa Nui	拉	帕努依岛(复活节岛)
6.	eventually	adv.	最后:终于
7.	islander	n.	岛上居民
8.	reveal	ν.	揭示;披露
9.	pole	n	杆:柱

10.	trunk	n.	树干
11.	simple machine		简单机械
12.	lever	n.	杠杆
13.	crew	12.	一队工作人员
14.	pile	ν,	堆积
15.	underneath	adv.	在下面;在底下
16.	straight	adv.	直立地
17.	demonstrate	ν.	展示,示范

Islanders demonstrate<sup>17</sup> how statues could have been raised long ago.

**Machines at Work:** 

# A World of Machines

机器在运转: 机械世界

When you hear the word machine, what's the first thing that comes to mind? A giant bulldozer<sup>t</sup> or a crane<sup>2</sup>? A bicycle? Today our world is filled with many types of machines that help us get work done.

ur lives would be very different without machines. They're everywhere! From the washer¹ that cleans your clothes to the bus that takes you to school, we depend on² machines for many things. To perform³ the many tasks⁴ they do, machines come in many forms. Some machines, such as a bulldozer or bicycle, have many moving parts. Others are so simple you probably don't even think of them as machines. A spoon⁵ is nothing but a stick with a little bowl on it. Yet in your hand it becomes a machine. Just try eating a bowl of hot oatmeal⁶ without one!

# What Exactly Are Machines?

In simple terms, a machine is anything that helps you do work. Scientists say that work has been done when a force<sup>8</sup> is used to move an object<sup>9</sup> over a distance<sup>10</sup>. A machine helps to make something move and can make work easier to do. Some machines are called simple machines. Simple machines do not have many moving parts. Machines like cars and dishwashers<sup>11</sup>—even bicycles—have many moving parts. Scientists call these compound machines<sup>12</sup>. Compound machines are made of<sup>13</sup> two or more simple machines put together.

13. be made of

1.	washer	11.	洗衣机
2.	depend on		依靠
3.	perform	ν.	执行
4.	task	11.	任务
5.	spoon	n.	匙: 调羹
6.	oatmeal	11.	燕麦粥、燕麦片
7.	exactly	adv.	精确地,准确地

8.	force	11.		,
9.	object	11.	物体:	对
10.	distance	11.		跑
11.	dishwasher	n.	洗	10
12	compound ma	chine	复合	机

#### **Six Simple Machines**

There are six different types of simple machines: the wedge<sup>1</sup>, the lever, the inclined plane<sup>2</sup> or ramp<sup>3</sup>, the screw<sup>4</sup>, the wheel and axle<sup>5</sup>, and the pulley<sup>6</sup>. While they will get work done in different ways, all simple machines do at least one of the following things:

- increase the speed of an object.
- increase the force that you can use.
- change the direction of a force.

Many machines do several<sup>7</sup> different things. A hammer<sup>8</sup>, which is a type of lever, lets you increase<sup>9</sup> the force you use to drive a nail into a board. A hammer can also let you change the direction of a force, such as when you push down on the handle<sup>10</sup> to pull a nail out of a board with the claw<sup>11</sup> of the hammer.

How can simple machines help you do work?

#### **The First Machines**

No one knows when the first machine was invented, but archaeologists<sup>12</sup> have found examples of stone tools dating to more than two million years ago. These tools were used mostly for cutting, scraping<sup>13</sup>, and chopping<sup>14</sup>. They are examples of one type of simple

## **Word Power**

The word machine comes from the Latin<sup>21</sup> word machina. The word machine can be used to describe simple devices<sup>22</sup>, such as wedges, as well as very complex<sup>23</sup> inventions, such as cars and rockets<sup>24</sup>. All machines use energy<sup>25</sup> to do work.

machine, the wedge.

#### Wedges—Splitting<sup>15</sup> It Up

Wedges come in two basic varieties<sup>16</sup>: broad<sup>17</sup> and flat like the head of an ax<sup>18</sup>, or round and pointed<sup>19</sup> like the tip of an arrow. Early humans probably didn't invent wedges but used naturally pointed sticks and stones. Eventually people learned how to make their own wedges by shaping rocks and sticks. They were even able to make knives as sharp as most modern-day blades<sup>20</sup>.

		-	
1.	wedge	71.	楔
2.	inclined plane		斜面
3.	ramp	11.	斜面
4.	screw	n.	螺杆:螺钉
5.	axle	n.	(轮)轴;车轴
6.	pulley	11.	滑轮:滑车
7.	several	adj.	几个的
8.	hammer	n.	锤子
9.	increase	ν.	增加
10.	handle	12.	柄:把手
11.	claw	n.	爪状物,爪形器具
12.	archaeologist	17.	考古学家
13.	scrape	ν.	刮;擦
14.	chop	ν.	砍,劈
15.	split	ν.	劈开: 使分离
16.	variety	17.	种类
17.	broad	adj.	宽的
18.	ax	17.	斧子
19.	pointed	adj.	尖的
20.	blade	n.	刀刃: 刀片
21.	Latin	adj.	拉丁语的
22.	device	n.	设备:装置
23.	complex	adj.	复杂的
24.	rocket	n.	火箭
25.	energy	n.	能量

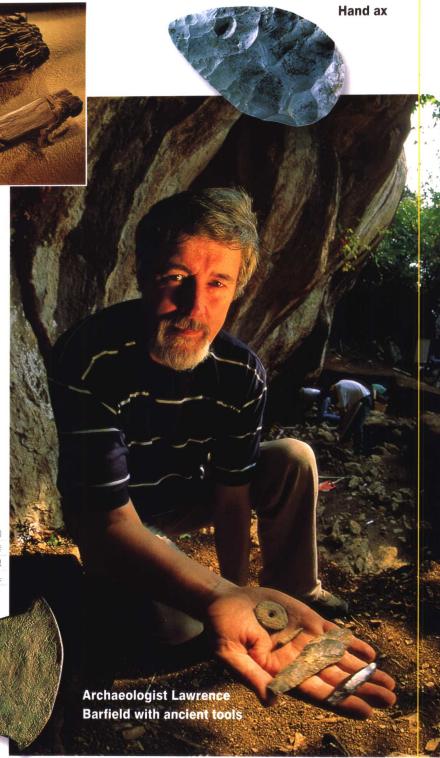

Ancient<sup>1</sup> stone-andwood knife with a holder<sup>2</sup> made of woven<sup>3</sup> grass

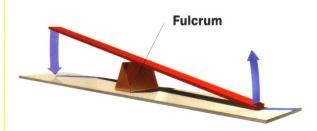

Ancient arrowhead4

1.	ancient	adj.	古代的。古老的
2.	holder	11.	套
3.	weave	ν.	编织
4	arrowhead	17	签斗

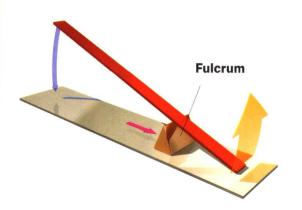

#### Levers—Getting a Lift

The first machine actually invented by humans was probably the lever. All you need to make a lever is a long stick and something to balance<sup>1</sup> it on—called a fulcrum<sup>2</sup>. When early humans wanted to move a heavy object like a large rock, they discovered they could use a tree limb<sup>3</sup> and another rock as a fulcrum to lift the first rock. If they put the fulcrum at the middle of the limb, they could

With the fulcrum in the center, when you push down on one end of the lever, an equal force pushes up on the other end.

With the fulcrum closer to one end of the lever, when you push down on the longer end of the lever, a greater force pushes up on the shorter end.

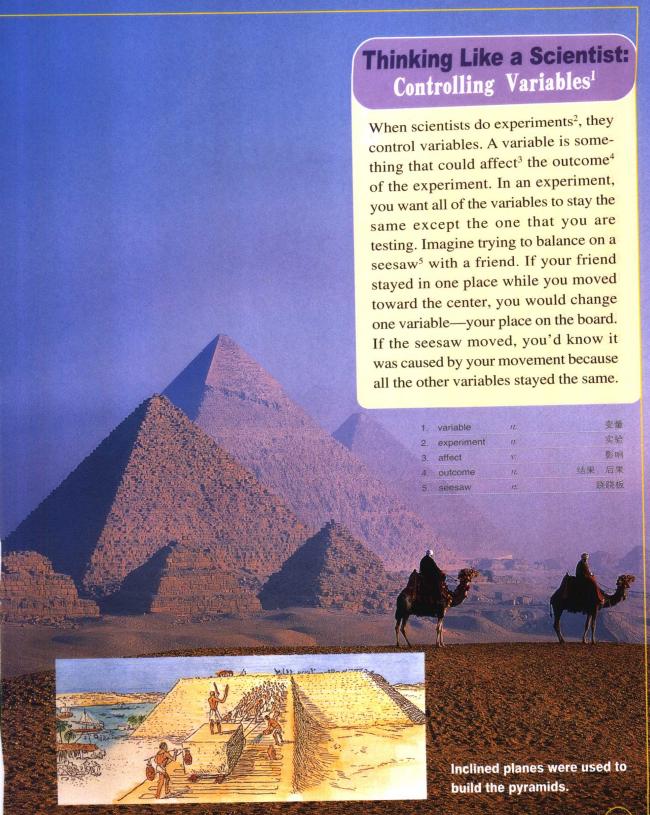

change the direction of force. But they wouldn't gain any extra lifting power. By moving the fulcrum closer to the object they wanted to lift, they could use less force to lift the object.

#### The Inclined Plane—Ramping Up

A third type of machine is the inclined plane or ramp. An inclined plane, such as a board with one end raised, lets you move things up and down with ease<sup>4</sup>. Instead of lifting an object straight up, you can push the object up the inclined plane.

Ancient Egyptian<sup>5</sup> engineers<sup>6</sup> knew the value of an inclined plane. The Great Pyramid of Khufu<sup>7</sup> in Giza<sup>8</sup> is more than 450 feet high and made of huge limestone<sup>9</sup> and granite<sup>10</sup> blocks—some weighing about 50 tons. To get the blocks to the top of the pyramid the Egyptians used ramps, ropes, and a great deal of muscle<sup>11</sup> power. The ramps let workers drag or push the stones to higher and higher levels. Archaeologists believe that it would have taken 20,000 people about 20 years to complete the Great Pyramid.

4	balanca		
1.	balance	ν.	平衡
2.	fulcrum	11.	杠杆支点
3.	limb	11.	树枝
4.	with ease		容易地
5.	Egyptian	adj.	埃及的
6.	engineer	n.	工程师
7.	Great Pyramid o	of Khufu	胡夫大金字塔
8.	Giza		吉萨(埃及北部城市, 金字塔
			和狮身人面像就在附近)
9.	limestone	71.	石灰岩
10.	granite	11.	花岗石
11.	muscle	77.	肌肉

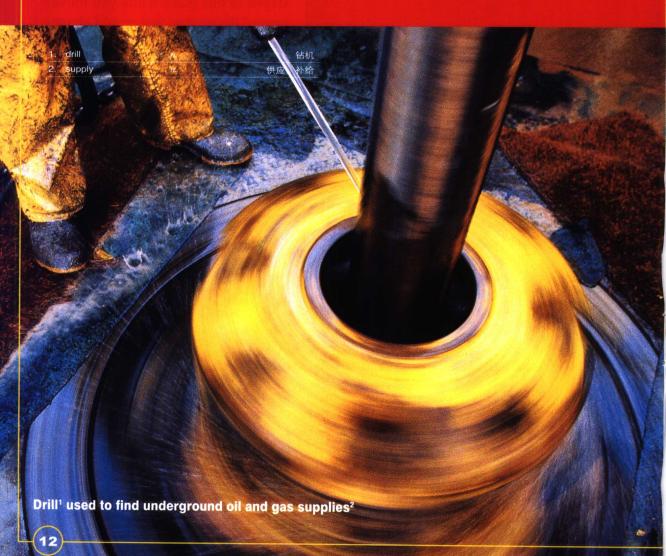

**Machines That Turn and Twist:** 

# Turning the World Around

旋转的机器:转动世界

Take a look around you. Do you see a wheel "hidden" in an object near you? Wheels are all around us making things spin¹, twist, and turn.

# The Wheel and Axle-Going for a Spin

Think about a wheel on a bike. The wheel turns, but it stays fixed to the bike. That's because in order for a wheel to spin around a certain point, it must have an axle. Without an axle, a wheel is not nearly<sup>2</sup> as useful.

Like levers and ramps, wheels were invented in ancient times. Archaeologists believe one of the first uses of the wheel was to make pottery<sup>3</sup>. In order to help shape clay<sup>4</sup>, potters<sup>5</sup> used a device called a turntable<sup>6</sup>. The turntables had a flat wheel that spun sideways<sup>7</sup> around an axle. The potters would start by putting clay on the top of the wheel. Then they would spin the wheel as they shaped the clay with their hands. The spinning wheel made it easier for the potters to make bowls and pots. Today many potters still use turntables that are similar<sup>8</sup> to the ones used long ago.

1.	spin	ν.	旋转
2.	nearly	adv.	几乎:接近
3.	pottery	n.	陶器
4.	clay	n.	泥土: 黏土
5.	potter	n.	陶工
6.	turntable	n.	转盘: 转台
7.	sideways	adv.	向一侧地; 从一边
8.	similar	adj.	相似的

A potter shaping clay on a turntable
