About the Author

DONALD H. SANDERS is the author of six books about computers—their uses and their impact—spanning 25 years. His books have been widely used by training programs in industry and government as well as by colleges and universities.

After receiving degrees from Texas A & M University and the University of Arkansas, Dr. Sanders was a professor at the University of Texas at Arlington, at Memphis State University, and at Texas Christian University. In addition to his books, Dr. Sanders has contributed articles to journals such as *Data Management*, *Automation*, *Banking*, *Journal of Small Business Management*, *Journal of Retailing*, and *Advanced Management Journal*. He has also encouraged his graduate students to contribute computer-related articles to national periodicals, and over 70 of these articles have been published. Dr. Sanders chairs the “Computers and Data Processing” Subject Examination Committee, CLEP Program, College Entrance Examination Board, Princeton, N.J.

Preface

Remember . . . when you thought a silicon chip was a new kind of snack food? Does it seem like only yesterday? It was.

Inc. magazine, April 1984.

In a figurative sense, it *was* only yesterday that components such as silicon chips were first introduced into strange machines called computers. But now it's today, and the pace from yesterday to today has been frenetic. In Lewis Carroll's *Through the Looking Glass*, Alice met the Red Queen in the garden. "Faster! faster!" the Queen urged, but "however fast they went they never seemed to pass anything." Finally, Alice observed that "in our country, . . . you'd generally get to somewhere else—if you ran very fast for a long time as we've been doing." "A slow sort of country!" replied the Queen. "Now, here, you see, it takes all the running you can do to keep in the same place. If you want to get somewhere else, you must run at least twice as fast as that."

Computer scientists and users have been running many times faster than that in the last few years, and we've now entered what has been termed the Information Age or the Age of the Computer. Computers, like automobiles and electricity, are now exerting a daily—and rapidly growing—influence on all of us. Thus, an essential outcome of the educational process today must be computer literacy. Computer literacy is "knowing" computers. It's knowing what they are, what they can and cannot do, how they are put to work, and how their use in homes, schools, and workplaces can affect society. It's vital, of course, to continue to educate the many thousands of people who will become computer specialists. And this book certainly contains the information required to introduce these future specialists to the subject of computers and data processing. But computer literacy is now needed by *all* students so that they will not be intimidated by

daily life, but will instead feel a sense of belonging in a computer-rich society.

THE DEVELOPMENT AND PURPOSE OF THIS EDITION

To paraphrase the Red Queen, it takes a significant effort or "run" in today's computing environment just to keep a text in the same relative place. But to move forward and make improvements, an author and publisher may need to "run at least twice as fast as that."

Work on the *development* of this edition of *Computers Today* began almost immediately with the release of the first edition. Research was carried out and plans were made to produce a new text—one that would not only move forward with the technology, but would also be improved in other ways. For example, the new chapter on personal computers has been acclaimed by reviewers for the thorough way it considers hardware capabilities and software packages. But personal computer concepts are also integrated throughout the text, and an extensive new art program featuring the use of personal computer systems has been created. Many other improvements are detailed later in this Preface. These improvements were required by the technology, demanded by the title of this book, and expected by its readers. The Red Queen would understand the need to thoroughly update a best-selling text in just two years!

Computers Today is designed for use in the introductory

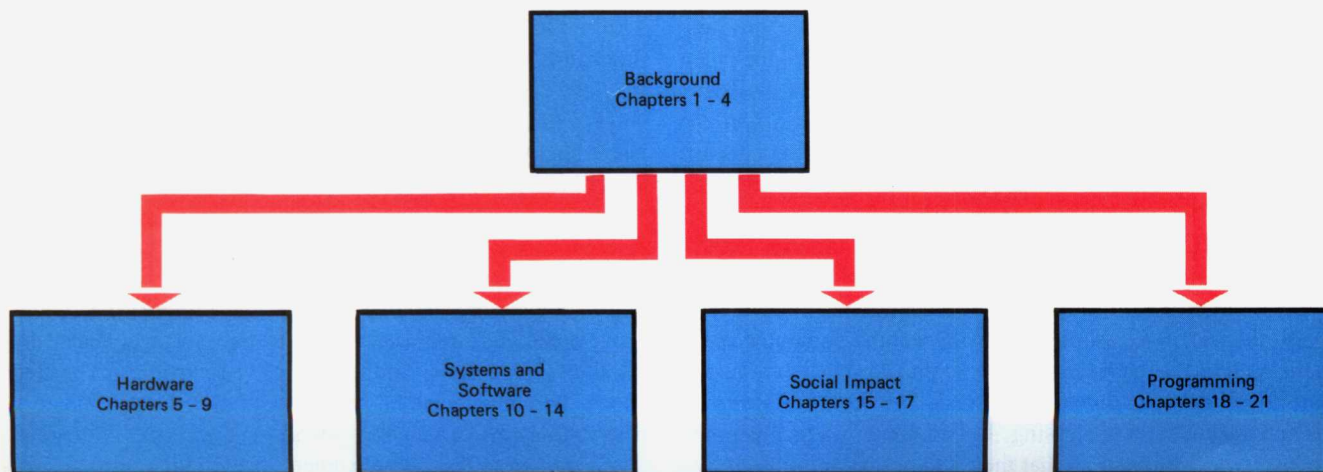

one-term course in computer data processing that's now taught throughout the world. Thus, it's suitable for computer literacy courses, for technically oriented programming courses, and for courses that attempt to strike a balance. This is true because the *purpose* of this book is to acquaint readers with *all four* of the following related areas of knowledge required for computer literacy:

1. **Computers themselves.** The organization, function, capabilities, and limitations of the equipment in modern computer systems of *all sizes* (personal, mini, mainframe, and supercomputer) are presented.
2. **What computers do.** Common data processing uses or applications of computers in today's society are treated. The focus is generally on business data processing applications, but many of the selected applications are also processed by not-for-profit organizations such as governments, hospitals, and schools.
3. **How computers are put to work.** The techniques used in the analysis and design of information systems are explained, and the procedures that are used to prepare programs are outlined. Programs for a number of the common data processing applications that have been identified earlier are then coded using the constructs of the BASIC language.
4. **The social impact of computers at work.** The ways in which people and organizations may be affected by present and future computer applications are presented.

FLEXIBLE ORGANIZATION AND INTEGRATED PROGRAMMING EXAMPLES

Two popular features unique to the first edition have been carried over to this revision. The *first* of these is the *modular organization* that permits the book to meet the needs of courses with different subject emphases and with different presentation sequences. This flexibility is possible because *Computers Today* is organized into five modules. An overview of the four areas of knowledge mentioned above is presented in the four chapters of the first Background Module. Students should read these chapters (1 through 4) in sequence, but once they have completed them, they can turn *immediately to any of the remaining modules* to meet whatever sequence and depth requirements are needed in a particular course (see the chart below). For example, after completing Chapter 4 they can then go directly to the Programming Module chapters (18 through 21) that are conveniently placed in this edition at the back of the book. Or, readers may be more motivated to study computer data processing if some time is spent on the Social Impact chapters (15 through 17) after Chapter 4 is completed. Of course, it's also logical to consider computing equipment in more detail (Chapters 5 through 9) and then move to the Systems and Software Module (Chapters 10 through 14) prior to studying programming concepts.

But you get the idea: *Computers Today* gives you the flexibility to choose the sequence that is best for your needs. It also permits you to vary the depth of the material covered in a one-term course. Although it's unlikely that you'll be

able to cover all 21 chapters in a single term, you'll have the freedom to select those topics that are most appropriate for your needs.

A *second* unique feature of *Computers Today* retained in this edition is the use of *integrated programming examples*. This innovative approach introduces readers to the methodology and techniques of computer programming. The programming examples used in most texts involve a series of unrelated data processing applications at a number of separate organizations. Since readers are often unfamiliar with common data processing systems and with the interrelated nature of the outputs produced by those systems, these examples are often viewed as random and boring exercises. To counter this problem, an enterprise created by two college students is presented and discussed in the early chapters. Some of the information needs of this business—R-K Enterprises—are outlined in a number of applications examples in Chapter 2. This theme of an "actual" business with realistic interrelated data processing needs is then carried to Chapters 18 through 21 in the Programming Module. Readers will see in Chapters 18 and 20 how the R-K Enterprises' applications presented in Chapter 2 are analyzed, flowcharted, and coded in the BASIC language. Chapter 20 provides sufficient material so that students can develop BASIC programming skills at a fundamental level. But if further development of programming skills is an objective of the course, additional R-K Enterprises' applications are then analyzed, flowcharted, and coded in an all-new Chapter 21 that explains more advanced features of the BASIC language. And *over two-dozen new end-of-chapter flowcharting/programming problems* built around R-K Enterprises' processing needs have been created for this edition. In fact, there's now a total of *over 50* BASIC programs tied to the R-K theme. Creating a realistic enterprise that students can identify with, discussing a number of the most common applications that such a business must process, and then carrying these interrelated applications through the analysis, flowcharting, and BASIC coding steps is unique to *Computers Today*.

ADDITIONAL REVISION FEATURES AND AIDS TO LEARNING

Included among the numerous revision features and learning aids found in this edition are:

- A careful reorganization of chapters and modules has been carried out to meet changing conditions.

For example, the chapters dealing with data communications and word processing/electronic mail systems have been moved to a restructured Systems and Software Module. The Social Impact Module has been repositioned, and, as noted earlier, the Programming Module is located at the back of the book.

- Hundreds of *full-color* photographs, drawings, and illustrations are provided, and a high percentage of these are new. For example, new photo galleries are presented in a number of chapters (e.g., 1, 8, 9), new drawings featuring the use of a personal computer system to process R-K Enterprises' applications are found in Chapter 2, and new art depicting the spreadsheet, graphic, word processing, and data base capabilities of integrated software packages are found in Chapter 4 and elsewhere.
- Although there are still 21 chapters in the book, some earlier material has been condensed, reorganized, and repositioned to make room for *four* new chapter titles. These new chapters are "Personal Computers: The Micro Miracles" (8), "Minis, Mainframes, and 'Monsters'" (9), "System Software Packages: Operating Systems and Data Base Management Systems" (13), and "More about BASIC" (21).
- A wealth of new and up-to-the-minute material has been added on dozens of topics including integrated software packages, primary and secondary storage components, I/O devices, the selection of personal computer applications programs, the international race to develop "fifth-generation" supercomputers, telecommuting systems, voice mail, local-area and digital PBX networks, expert systems, organizational information centers, micro-to-mainframe linkages, artificial intelligence research—this list could go on and on!
- Most of the following aids to learning are either all new or substantially revised: (1) The *vignettes* used to open a chapter and highlight some aspect of its contents; (2) the *boxed inserts* included in each chapter to provide applications, cases, and items of interest to support chapter material and stimulate discussions; (3) the *Closer Look* reading following each chapter that provides additional information on selected topics.

- A new *Projects to Look Into* section has been added at the end of most chapters to suggest student research topics that are based on material presented in the chapters. Some projects may be completed at a library, while others require visits to computer stores and/or computer-using organizations.
- Learning aids carried over from the first edition include *Chapter Outlines*, *Looking Ahead learning objectives*, *Feedback and Review sections* with answers, *Looking Back chapter summaries*, listings of *Key Terms and Concepts*, *Topics for Review and Discussion*, and a *Glossary*.

SUPPLEMENTS FOR THIS EDITION

Numerous supplements have been prepared to make the *Computers Today* package a complete teaching/learning tool. They include:

- **Inside Computers Today.** This student Study Guide is designed to provide extensive self-tests for each corresponding chapter in *Computers Today*. Each Study Guide chapter contains learning objectives; a chapter overview and summary; and varied self-test sections including key term matching, multiple choice, true or false, and completion exercises. Answers for all exercises are included in the Study Guide. *Inside Computers Today* is an instrument planned to reinforce and integrate text concepts. It is designed for success—no “tricky” questions have been included intentionally. Successfully completing the Study Guide exercises should increase the confidence of all levels of students. It is a straightforward, no-frills, self-testing implement written for students, not for teachers.
- **The Computers Today Software Supplement.** This new applications software is designed to give students hands-on experience with an integrated software package. Using examples from R-K Enterprises, students learn word processing, database management, spreadsheeting, and graphics. In addition to the student disks, McGraw-Hill will provide adopters with an instructor’s gradebook disk. Features of the gradebook include checking attendance and computing grades.

- **Instructor’s Resource Kit.** The components of this Kit provide instructors with extensive support materials for teaching a course with *Computers Today*. The following supplements are included:

1. **Instructor’s Manual.** Beyond supplying resource material for each chapter of the text, this Manual contains FORTRAN, COBOL, and Pascal programs dealing with R-K Enterprises applications. (The logic of each program is analyzed in text Chapter 18.) These programs use the same input data and produce the same output results as the BASIC programs discussed in Chapter 20 of the text. The Manual also supplies transparency masters and a bibliography of selected references.
 2. **Overhead Transparencies.** A set of 64 color transparencies serves as a visual classroom aid which can be used to further explain text concepts.
 3. **Test Bank.** This completely reworked set of more than 2,600 questions covers the important ideas and definitions in *Computers Today*. For your convenience the test bank is available for use with the computer. *MicroExaminer* allows you to generate tests using your Apple IIc or II+, IBM PC, or TRS 80 microcomputer. Questions can be scrambled into two versions, allowing you to create alternative exams for multiple sections of the same course. You also have the option of adding your own questions to the test bank. *The EXAMINER System* contains a magnetic tape which can be installed in your computer center, and offers the same features as *MicroExaminer*.
- **Structured COBOL: A Beginner’s Guide.** This revised manual is intended to be a beginner’s guide to solving and coding COBOL programs. The revision covers most of the basic formats and commands recommended by the American National Standards Institute (ANSI), with modifications for the beginning student. The authors of this manual are Frederick R. Prisco and Charles J. McNerney, both of Bergen Community College.
 - **Pascal Supplement.** This supplement to accompany *Computers Today* parallels wherever possible the material presented in text chapters 20 (Programming with BASIC) and 21 (More about BASIC). All the

programs appearing in these chapters are rewritten in Pascal. The author of this manual is Philip Drummond of Queens College.

- **Slide Package.** This set of 36 color slides will give your students a visual orientation to the course. This package contains new photographs, many not found in the text, that introduce your students to computers.
- **BASICard.** This convenient pocket-sized card enables students to have important BASIC commands and codes always at their fingertips. A great aid for student programming.

ACKNOWLEDGMENTS

It's customary for authors to conclude a preface by acknowledging the contributions and suggestions received from numerous sources. This is particularly appropriate in the case of *Computers Today* because a colorful package of this scope just doesn't happen without the input of many people.

The authorities who responded to a research study and helped reshape the content and organization of *Computers Today*, and the professionals who reviewed the manuscript

and made many helpful suggestions are acknowledged separately following this Preface.

Another word of thanks must go to the equipment manufacturers, publishers, and photo agencies who furnished materials, excerpts, and photographs for this text. Their individual contributions are acknowledged in the body of the book.

The final tribute and greatest appreciation, however, is reserved for these few: to Barbara Brooks, who somehow found time in the midst of new responsibilities to turn in another incredible developmental editing job—her inspired ideas and creative talents are visible on almost every page; to Mel Haber, whose last design, you're convinced, can't be topped—and then you see his next one; to Phil Galea and Lorinda Morris, whose production and photo research efforts continue to surprise a critical author; to Ed Hanson, who efficiently manages complex projects without a hitch; to Eric Munson and Christina Mediate for their editorial support; to Rob Fry for his efforts on the supplements; to Hal Sackman for his time and efforts on the test manual; to Anne Green for her artistic talents; to Gary D. Sanders, University of Illinois, for his additional program contributions and suggestions; and to Joyce Sanders for her continuing suggestions and encouragement.

Donald H. Sanders
