#### **Preface**

Our intent in organizing this volume was to provide in one source a detailed description of the major techniques currently available for the study of significant arachidonic acid metabolites. In editing the contributions, we tried to make certain that adequate experimental detail was included. There are often different approaches that can be used to achieve a given result. One may be better suited to one laboratory than another; moreover, a seemingly minor detail may make the difference between success and failure in adapting a procedure. Therefore, in several instances, apparently redundant descriptions of methodologies (e.g., prostaglandin endoperoxide preparation) have been included.

While we accept responsibility for the final selection of topics, we would like to thank many of the contributors for their advice in this selection process. We also received important suggestions, comments, and advice from a number of other investigators whom we also wish to acknowledge, including Drs. Philip Needleman, John E. Pike, Robert R. Gorman, Lawrence J. Marnett, J. Bryan Smith, Aaron Marcus, and J. Throck Watson.

The organization, correspondence, and editing necessary to bring this effort to fruition would not have been possible without the skillful and cheerful assistance of Ms. Susan Uselton and Ms. Stephanie Lewis. We owe them, as well as the staff of Academic Press, a special debt of thanks for their help.
