Cover design: Wiley

Cover image: SpaceX

This is a photograph of the rocket propulsion system at the aft end of the recoverable booster stage of the Falcon 9 Space Launch Vehicle. This propulsion system has nine Merlin liquid propellant rocket engines, but only eight of these can be seen in this view. The total take-off thrust at sea level is approximately 1.3 million pounds of thrust force and at orbit altitude (in a vacuum) it is about 1.5 million pounds of thrust. Propellants are liquid oxygen and RP-1 kerosene. More information about this multiple rocket engine propulsion system can be found in Chapter 11 Section 2 and more information about RP-1 kerosene can be found in Chapter 7. The Falcon space vehicle and the Merlin rocket engines are designed, developed, manufactured, and operated by Space Exploration Technologies Corporation, better known as SpaceX, of Hawthorne, California.

This book is printed on acid-free paper. ∞

# ROCKET PROPULSION ELEMENTS

# PREFACE

---

The rocket propulsion business in the United States of America appears to be changing. In the past, and also currently, the business has been planned, financed, and coordinated mostly by the Department of Defense and NASA. Government funding, government test or launch facilities, and other government support was provided. As it happens in all fields old-time companies have changed ownership, some have been sold or merged, some went out of business, some reduced the number of employees, and other companies have entered the field. New privately financed companies have sprung up and have developed their own rocket propulsion systems and flight vehicles as well as their own test, manufacturing, and launch facilities. These new companies have received some government contracts. Several privately owned companies have developed on their own useful space vehicles and rocket propulsion systems that were not originally in the government's plan. Although business climate changes noticeably influence rocket activities, it is not the purpose of this book to describe such business effects, but to present rocket propulsion principles and to give recent information and data on technical and engineering aspects of rocket propulsion systems.

All aerospace developments are aimed either at better performance, or higher reliability, or lower cost. In the past, when developing or modifying a rocket propulsion system for space applications, the emphasis has been primarily on very high reliability and, to a lesser extent, on high performance and low cost. Each of the hundreds of components of a propulsion system has to do its job reliably and without failure during operation. Indeed, the reliability of space launches has greatly improved world wide. In recent years emphasis has been placed primarily on cost reduction, but with continuing lower priority efforts to further improve performance and reliability. Therefore, this Ninth Edition has a new section and table on cost reduction of rocket

propulsion systems. Also, in this book environmental compatibility is considered to be part of reliability

This Ninth Edition is organized into the same 21 chapters and subjects, as in the Eighth Edition, except that some aspects are treated in more detail. The names of the 21 chapters can be found in the Table of Contents. There are some changes, additions, improvements, and deletions in every chapter. A few problems have printed answers so students or other readers can self-check their solutions.

About half of this new edition is devoted to chemical rocket propulsion (solid propellant motors, liquid propellant rocket engines, and hybrid rocket propulsion systems). The largest number of individual rocket propulsion systems (currently in use, on stand-by, or in production) are solid propellant rocket motors; they vary in size, complexity, and duration; most systems are for military or defense applications. The next largest number in production or currently in use for space flight or missile defense are liquid propellant rocket engines; they vary widely in size, thrust or duration. Many people in aerospace consider this rocket propulsion technology to be mature. Enough technical information is available from public sources and from skilled personnel so that any new or modified rocket propulsion system can be developed with some confidence.

There have been several new applications (different flight vehicles, different missions) using existing or modified rocket propulsion systems. Several of these new applications are mentioned in this book.

Compared to the prior edition this new edition has less information or data of recently retired rocket engines, such as the engines for the Space Shuttle (retired in 2011) or Energiya; these have been replaced with facts from rocket propulsion systems that are likely to be in production for a long time. This new edition gives data on several rocket propulsion systems that are currently in production; examples are the RD-68 and the Russian RD-191 engines. Relatively little discussion of current research and developments is contained in this Ninth Edition; this is because it is not known when any particular development will lead to a better propulsion system, a better material of construction, a better propellant, or a better method of analysis, even if it appears to be promising at the present time. It is unfortunate that a majority of Research and Development programs do not lead to production applications.

Subjects new to the book include the Life of Liquid Propellant Thrust Chambers, a powerful new solid propellant explosive ingredient and two sections on variable thrust rocket propulsion. The discussion of dinitrogen oxide propellant is new, and additions were made to the write-ups of hydrogen peroxide and methane. Several different liquid propellant rocket engines are shown as examples of different engine types. The rocket propulsion system of the MESSENGER space probe is described as an example of a multiple thruster pressure feed system; its flow diagram replaces the Eighth Edition's one for the Space Shuttle. The Russian RD-191 engine (for the Angara series of launch vehicles) serves as an example for a high performance staged combustion engine cycle. The RD-68A presently has the highest thrust of any liquid oxygen/liquid hydrogen engine and it is an example of an advanced gas generator

engine cycle. The RD-0124 illustrates an upper stage rocket engine with four thrust chambers and a single turbopump. Currently, a new manufacturing process known as Additive Manufacturing is being investigated for replacing parts or components of existing liquid propellant rocket engines.

The Ninth Edition also has the following other subjects, which are new to this book: upper stages with all electric propulsion, a dual inlet liquid propellant centrifugal pump for better cavitation resistance, topping-off cryogenic propellant tanks just prior to launching, benefits of pulsing of small thrusters, avoiding carbon containing deposits in the passages of liquid propellant cooling jackets, and a two-kilowatt arcjet. Since it is unlikely that nuclear power rocket propulsion systems development will again be undertaken in the next decade or that gelled propellants or aerospike nozzles will enter into production anytime soon, these three topics have largely been deleted from the new edition.

All Problems and Examples have been reviewed. Some have been modified, and some are new. A few of the problems which were deemed hard to solve have been deleted. The index at the end of the book has been expanded, making it somewhat easier to find specific topics in the book.

Since its first edition in 1949 this book has been a most popular and authoritative work in rocket propulsion and has been acquired by at least 77,000 students and professionals in more than 35 countries. It has been used as a text in graduate and undergraduate courses at about 55 universities. It is the longest living aerospace book ever, having been in print continuously for 67 years. It is cited in two prestigious professional awards of the American Institute of Aeronautics and Astronautics. Earlier editions have been translated into Russian, Chinese, and Japanese. The authors have given lectures and three-day courses using this book as a text in colleges, companies and Government establishments. In one company all new engineers are given a copy of this book and asked to study it.

As mentioned in prior editions, the reader should be very aware of the hazards of propellants, such as spills, fires, explosions, or health impairments. The authors and the publisher recommend that readers of this book do not work with hazardous propellant materials or handle them without an exhaustive study of the hazards, the behavior, and properties of each propellant, and without rigorous safety training, including becoming familiar with protective equipment. People have been killed, when they failed to do this. Safety training and propellant information is given routinely to employees of organizations in this business. With proper precautions and careful design, all propellants can be handled safely. Neither the authors nor the publisher assume any responsibility for actions on rocket propulsion taken by the reader, either directly or indirectly. The information presented in this book is insufficient and inadequate for conducting propellant experiments or rocket propulsion operations.

This book and its prior editions use both the English Engineering (EE) system of units (foot, pound) and the SI (Système International) or metric system of units (m, kg), because most drawings and measurements of components and subassemblies of chemical rocket propulsion systems, much of the rocket propulsion design and most of the manufacturing is still done in EE units. Some colleges and research

organizations in the United States, and most propulsion organizations in other countries use the SI system of units. This dual set of units is used, even though the United States has been committed to switch to SI units.

Indeed the authors gratefully acknowledge the good help and information obtained from experts in specific areas of propulsion. James H. Morehart, The Aerospace Corporation, (information on various rocket engines and propellants) 2005 to 2015; Jeffrey S. Kincaid, Vice President (retired), Aerojet Rocketdyne, Canoga Park, CA (RS-68 engine data and figures, various propulsion data) 2012 to 2015; Roger Berenson, Engine Program Chief Engineer, Aerojet Rocketdyne, Canoga Park, CA, (RS-68 and RS-25 engine and general propulsion data) 2015; Mathew Rottmund, United Launch Alliance, Centennial, CO. (launch vehicle propulsion issues), 2014 to 2015; Olwen M. Morgan (retired), Marketing Manager, Aerojet Rocketdyne, Redmond, WA, (MESSENGER space probe; monopropellants); 2013 to 2016; Dieter M. Zube, Aerojet Rocketdyne, Redmond (view and data on hydrazine arcjet); 2013-2015; Jeffrey D. Haynes, Manager, Aerojet Rocketdyne, (additive manufacturing information), 2015; Leonard H. Caveny, Consultant, Fort Washington, MD, (solid propellant rocket motors); Russell A. Ellis, Consultant, (solid propellant rocket motors); 2015; David K. McGrath, Director Systems Engineering, Orbital ATK, Missile Defense and Controls, Elkton, MD, (solid propellant rocket motors); 2014 to 2015; Eckart W. Schmidt, Consultant for Hazardous Materials, Bellevue, WA, (Hydrazine and liquid propellants), 2013 to 2015; Michael J. Patterson, Senior Technologist, In-Space Propulsion, NASA Glenn Research Center, Cleveland, OH (electric propulsion information), 2014; Rao Manepalli, Deptford, NJ, formerly with Indian Space Research Organization (rocket propulsion systems information); 2011 to 2013; Dan Adamski, Aerojet Rocketdyne, (RS-68 flowsheet), 2014; Frederick S. Simmons (retired), The Aerospace Corporation (review of Chapter 20); 2015 to 2016.

The authors have made an effort to verify and/or validate all information in this ninth edition. If the reader finds any errors or important omissions in the text of this edition we would appreciate bringing them to our attention so that we may evaluate them for possible inclusion in subsequent printings.

<b>PREFACE</b>	<b>xvii</b>
<b>1 Classification</b>	<b>1</b>
1.1. Duct Jet Propulsion / 2	
1.2. Rocket Propulsion / 4	
<i>Chemical Rocket Propulsion / 5</i>	
<i>Combinations of Ducted Jet Engines and Rocket Engines / 9</i>	
<i>Nuclear Rocket Engines / 10</i>	
<i>Electric Rocket Propulsion / 10</i>	
<i>Other Rocket Propulsion Concepts / 12</i>	
<i>International Rocket Propulsion Effort / 13</i>	
1.3. Applications of Rocket Propulsion / 14	
<i>Space Launch Vehicles / 14</i>	
<i>Spacecraft / 20</i>	
<i>Military and Other Applications / 21</i>	
References / 24	
<b>2 Definitions and Fundamentals</b>	<b>26</b>
2.1. Definitions / 26	
2.2. Thrust / 31	
2.3. Exhaust Velocity / 33	

- 2.4. Energy and Efficiencies / 35
- 2.5. Multiple Propulsion Systems / 38
- 2.6. Typical Performance Values / 39
- 2.7. Variable Thrust / 40
  - Symbols / 41
    - Greek Letters* / 42
  - Problems / 42
  - References / 44

### 3 Nozzle Theory and Thermodynamic Relations

45

- 3.1. Ideal Rocket Propulsion Systems / 45
- 3.2. Summary of Thermodynamic Relations / 47
- 3.3. Isentropic Flow through Nozzles / 51
  - Velocity* / 52
  - Nozzle Flow and Throat Condition* / 57
  - Thrust and Thrust Coefficient* / 61
  - Characteristic Velocity and Specific Impulse* / 63
  - Under- and Overexpanded Nozzles* / 67
  - Influence of Chamber Geometry* / 72
- 3.4. Nozzle Configurations / 73
  - Cone- and Bell-Shaped Nozzles* / 75
- 3.5. Real Nozzles / 81
  - Boundary Layers* / 82
  - Multiphase Flow* / 83
  - Other Phenomena and Losses* / 85
  - Performance Correction Factors* / 85
  - Four Performance Parameters* / 89
- 3.6. Nozzle Alignment / 91
  - Symbols / 93

    - Subscripts* / 186
  - Problems / 186
  - References / 187

## **6 Liquid Propellant Rocket Engine Fundamentals** **189**

- 6.1. Types of Propellants / 192
- 6.2. Propellant Tanks / 196
- 6.3. Propellant Feed Systems / 203
  - Local Pressures and Flows* / 203
- 6.4. Gas Pressure Feed Systems / 205

- 6.5. Tank Pressurization / 212
  - Factors Influencing the Required Mass of Pressurizing Gas* / 214
  - Simplified Analysis for the Mass of Pressurizing Gas* / 215
- 6.6. Turbopump Feed Systems and Engine Cycles / 217
  - Engine Cycles* / 218
- 6.7. Rocket Engines for Maneuvering, Orbit Adjustments, or Attitude Control / 229
- 6.8. Engine Families / 232
- 6.9. Valves and Pipelines / 233
- 6.10. Engine Support Structure / 239
  - Symbols / 239
  - Subscripts* / 239
  - Problems / 240
  - References / 242

## 7 Liquid Propellants

244

- 7.1. Propellant Properties / 245
  - Economic Factors* / 245
  - Performance of Propellants* / 246
  - Common Physical Hazards* / 250
  - Desirable Physical Properties* / 252
  - Ignition, Combustion, and Flame Properties* / 254
  - Property Variations and Specifications* / 254
  - Additives* / 255
- 7.2. Liquid Oxidizers / 255
  - Liquid Oxygen ( $O_2$ ) (LOX)* / 255
  - Hydrogen Peroxide ( $H_2O_2$ )* / 256
  - Nitric Acid ( $HNO_3$ )* / 257
  - Nitrogen Tetroxide ( $N_2O_4$ ) (NTO)* / 258
  - Nitrous Oxide ( $N_2O$ )* / 259
  - Oxidizer Cleaning Process* / 259
- 7.3. Liquid Fuels / 259
  - Hydrocarbon Fuels* / 260
  - Liquid Hydrogen* / 261
  - Hydrazine ( $N_2H_4$ )* / 262
  - Unsymmetrical Dimethylhydrazine [ $(CH_3)_2NNH_2$ ]* / 263

- Monomethylhydrazine (CH<sub>3</sub>NHNH<sub>2</sub>)* / 263
- 7.4. Liquid Monopropellants / 264
  - Hydrazine as a Monopropellant* / 264
- 7.5. Gaseous Propellants / 266
- 7.6. Safety and Environmental Concerns / 267
  - Symbols / 268
    - Greek Letters* / 268
  - Problems / 268
  - References / 269

## 8 Thrust Chambers

271

- 8.1. Injectors / 276
  - Injector Flow Characteristics* / 280
  - Factors Influencing Injector Behavior* / 283
- 8.2. Combustion Chamber and Nozzle / 285
  - Volume and Shape* / 285
  - Heat Transfer Distribution* / 288
  - Cooling of Thrust Chambers* / 289
  - Hydraulic Losses in the Cooling Passage* / 295
  - Thrust Chamber Wall Loads and Stresses* / 296
- 8.3. Low-Thrust Rocket Thrust Chambers or Thrusters / 300
- 8.4. Materials and Fabrication / 304
- 8.5. Heat Transfer Analysis / 310
  - General Steady-State Heat Transfer Relations* / 311
  - Transient Heat Transfer Analysis* / 315
  - Steady-State Transfer to Liquids in Cooling Jacket* / 317
  - Radiation* / 321
- 8.6. Starting and Ignition / 322
- 8.7. Useful Life of Thrust Chambers / 325
- 8.8. Random Variable Thrust / 326
- 8.9. Sample Thrust Chamber Design Analysis / 328
  - Symbols / 338
    - Greek Letters* / 338
    - Subscripts* / 339
  - Problems / 339
  - References / 342

## 9 Liquid Propellant Combustion and Its Stability

344

- 9.1. Combustion Process / 344

*Injection/Atomization Zone / 346*

*Rapid Combustion Zone / 347*

*Streamtube Combustion Zone / 348*

9.2. Analysis and Simulation / 348

9.3. Combustion Instability / 349

*Rating Techniques / 357*

*Control of Instabilities / 358*

Problems / 362

References / 362

## **10 Turbopumps and Their Gas Supplies**

**365**

10.1. Introduction / 365

10.2. Descriptions of Several Turbopumps / 366

10.3. Selection of Turbopump Configuration / 371

10.4. Flow, Shaft Speeds, Power, and Pressure Balances / 376

10.5. Pumps / 378

*Classification and Description / 378*

*Pump Parameters / 379*

*Influence of Propellants / 385*

10.6. Turbines / 387

*Classification and Description / 387*

*Turbine Performance and Design Considerations / 389*

10.7. Approach to Turbopump Preliminary Design / 390

10.8. Gas Generators and Preburners / 393

Symbols / 395

*Greek Letters / 396*

*Subscripts / 396*

Problems / 396

References / 397

## **11 Engine Systems, Controls, and Integration**

**399**

11.1. Propellant Budget / 399

11.2. Performance of Complete or Multiple Rocket Propulsion Systems / 401

11.3. Engine Design / 403

11.4. Engine Controls / 412

*Control of Engine Starting and Thrust Buildup / 413*

*Automatic Controls / 419*

*Control by Computer* / 421

11.5. Engine System Calibration / 423

*Engine Health Monitoring System* / 428

11.6. System Integration and Engine Optimization / 430

Symbols / 431

*Greek Letters* / 431

*Subscripts* / 432

Problems / 432

References / 433

## 12 Solid Propellant Rocket Motor Fundamentals

434

12.1. Basic Relations and Propellant Burning Rate / 439

*Mass Flow Relations* / 444

*Burning Rate Relation with Pressure* / 445

*Burning Rate Relation with Ambient Temperature*

$(T_b)$  / 449

*Variable Burning Rate Exponent  $n$*  / 452

*Burning Enhancement by Erosion* / 453

*Other Burning Rate Enhancements* / 455

12.2. Other Performance Issues / 457

12.3. Propellant Grain and Grain Configuration / 462

*Slivers* / 471

12.4. Propellant Grain Stress and Strain / 472

*Material Characterization* / 473

*Structural Design* / 476

12.5. Attitude Control and Side Maneuvers with Solid Propellant Rocket Motors / 483

Symbols / 485

*Greek Letters* / 486

*Subscripts* / 486

Problems / 486

References / 488

## 13 Solid Propellants

491

13.1. Classification / 491

13.2. Propellant Characteristics / 497

13.3. Hazards / 505

*Inadvertent Ignition* / 505

- Aging and Useful Life* / 506
- Case Overpressure and Failure* / 506
- Insensitive Munitions* / 508
- Upper Pressure Limit* / 510
- Toxicity* / 510
- Safety Rules* / 510
- 13.4. Propellant Ingredients / 511
  - Inorganic Oxidizers* / 513
  - Fuels* / 516
  - Binders* / 516
  - Burning-Rate Modifiers* / 517
  - Plasticizers* / 518
  - Curing Agents or Crosslinkers* / 518
  - Energetic Binders and Plasticizers* / 518
  - Organic Oxidizers or Explosives* / 518
  - Additives* / 519
  - Particle-Size Parameters* / 520
- 13.5. Other Propellant Categories / 522
  - Gas Generator Propellants* / 522
  - Smokeless or Low-Smoke Propellant* / 523
  - Igniter Propellants* / 524
- 13.6. Liners, Insulators, and Inhibitors / 525
- 13.7. Propellant Processing and Manufacture / 528
  - Problems / 531
  - References / 534

**14 Solid Propellant Combustion and Its Stability**

**536**

- 14.1. Physical and Chemical Processes / 536
- 14.2. Ignition Process / 540
- 14.3. Extinction or Thrust Termination / 541
- 14.4. Combustion Instability / 543
  - Acoustic Instabilities* / 544
  - Analytical Models and Simulation of Combustion Stability* / 548
  - Combustion Stability Assessment, Remedy, and Design* / 548
  - Vortex-Shedding Instability* / 551
- Problems / 552
- References / 553
