Variational Methods in Image Processing

CHAPMAN & HALL/CRC Mathematical and computational Imaging sciences

Series Editors

Chandrajit Bajaj

Center for Computational Visualization The University of Texas at Austin Guillermo Sapiro

Department of Electrical and Computer Engineering Duke University

Aims and Scope

This series aims to capture new developments and summarize what is known over the whole spectrum of mathematical and computational imaging sciences. It seeks to encourage the integration of mathematical, statistical and computational methods in image acquisition and processing by publishing a broad range of textbooks, reference works and handbooks. The titles included in the series are meant to appeal to students, researchers and professionals in the mathematical, statistical and computational sciences, application areas, as well as interdisciplinary researchers involved in the field. The inclusion of concrete examples and applications, and programming code and examples, is highly encouraged.

Published Titles

Image Processing for Cinema by Marcelo Bertalmío

Image Processing and Acquisition using Python by Ravishankar Chityala and Sridevi Pudipeddi

Statistical and Computational Methods in Brain Image Analysis by Moo K. Chung

Rough Fuzzy Image Analysis: Foundations and Methodologies by Sankar K. Pal and James F. Peters

> Variational Methods in Image Processing by Luminita A. Vese and Carole Le Guyader

Theoretical Foundations of Digital Imaging Using MATLAB® by Leonid P. Yaroslavsky

Proposals for the series should be submitted to the series editors above or directly to:

CRC Press, Taylor & Francis Group

3 Park Square, Milton Park, Abingdon, OX14 4RN, UK

Preface

This manuscript is devoted to variational models, their corresponding Euler–Lagrange equations and numerical implementations for image processing. Such techniques allow us to solve many inverse problems by minimization and regularization using rigorous tools from function spaces, calculus of variations, numerical analysis, and scientific computing. The most important problems in image processing are studied here, such as image restoration and image segmentation. Other related problems and applications are also presented and analyzed in detail. The variational approach offers an optimal and elegant solution in many cases, given knowledge about the image formation model, constraints, and a priori information. The variational method by regularization has been proven to be one of the most powerful techniques for solving many image processing tasks. This book covers numerous methods and applications, with accompanying tables, illustrations, algorithms, exercises, and online electronic material. It seeks to balance the theory with practice and the use of computational approaches.

Our goal is to offer a general textbook on variational approaches for image processing. Several topics are discussed in detail and may appeal to a larger audience. Instead of minimizing overlap with existing textbooks, the aim is for a more comprehensive and up-to-date presentation.

Each chapter includes the presentation of the problem, its mathematical formulation as a minimization operation, discussion and analysis of its mathematical well-posedness, derivation of the associated Euler-Lagrange equations, numerical approximations and algorithm descriptions, several numerical results, and a list of exercises.

In line with a desire for accessibility, this book attempts to be a self-contained guide to variational models in image processing, providing a synopsis of the required mathematical background necessary to understand the presented methods.

There are a number of successful advanced texts, including textbooks, on variational models and partial differential equations for image processing and related topics from image analysis and computer vision. This is a proof of the strong and continuing interest in these areas. This textbook focuses specifically on the principles and techniques for variational image processing and applications, balancing the traditional computational models with the more modern techniques developed to answer new challenges introduced by the new image acquisition devices.

The audience

This text is intended primarily for advanced undergraduate and graduate students in applied mathematics, scientific computing, medical imaging, computer vision, computer science, engineering and related fields and for engineers, professionals from academia, and the image processing industry. The manuscript can be used as a textbook for a graduate course or for a graduate summer school. It will serve as a self-contained handbook and detailed overview of the relevant variational models for image processing. The general area of image processing and its state-of-the-art methods have become essential in many fields, including medical imaging, defense, surveillance, Internet, television, image transmission, special effects, physics, astronomy, and other fields that require image acquisition for further processing and analysis.

Topics not covered

There are many other important topics in variational image processing that could not be covered here. These include higher-order models, wavelet and statistical methods, convexification algorithms for image segmentation and partition, proximal point methods, and other relevant applications from computer vision and medical imaging.

Additional resources

Electronic resources accompany the manuscript. These can be found at the online link given below, and include MATLAB[®] codes for the main models and algorithms presented in the manuscript. The electronic resources will be updated when necessary. Other useful resources to students, instructors, researchers and practitioners will be found as well at this link:

Acknowledgments

This text wouldn't have been possible without the tremendous support, work, inspiration and dedication of all our mentors, students, collaborators, and families.

Luminita Vese thanks all her mentors: Dorel Miheţ from West University of Timişoara who introduced her to mathematics and its rigor; her Ph.D. advisors Gilles Aubert and Michel Rascle, from the University of Nice-Sophia Antipolis, who introduced her to variational models in image processing, the topic of this text; and finally, her postdoctoral mentors Tony Chan and Stanley Osher, from the University of California, Los Angeles, who introduced her to many interesting and challenging problems in image processing and guided her throughout the years.

Luminita Vese thanks all her Ph.D. students for their hard work, talent, and dedication: Triet Le, Linh Lieu, Ginmo Chung, Nicolay Tanushev, Chris Elion, Yunho Kim, Miyoun Jung, Tungyou Lin, Pascal Getreuer, Carl Lederman, Ming Yan, Melissa Tong, and Hayden Schaeffer. This text would not have been possible without their enormous contributions to variational methods in image processing. The text contains numerous results obtained by Miyoun Jung, Ginmo Chung, Triet Le, Tungyou Lin, Nicolay Tanushev, and Ming Yan; she is very grateful to all of them.

Luminita Vese is grateful to her colleagues in the Mathematics Department from the University of California, Los Angeles for their constant support, especially to Andrea Bertozzi, John Garnett, and Stanley Osher.

Also, special thoughts go to her dear family for all the love, support and sacrifice throughout the years.

Carole Le Guyader thanks her mentors: Christian Gout from the National Institute of Applied Sciences of Rouen, who trusted her and guided her throughout the years, and Luminita Vese from the University of California, Los Angeles, for her constant support and kindness, for providing her with appealing new challenges in imaging sciences, and for her strong commitment.

Carole Le Guyader also thanks her colleague Nicolas Forcadel from the National Institute of Applied Sciences of Rouen for the enlightening mathematical discussions about the theory of viscosity solutions and calculus of variations and for his friendship.

She also thanks her Ph.D. students Ratiba Derfoul and Solène Ozeré for their involvement, diligence, and skills. A special thought goes to her grandfather André Le Corff for his unfailing love and to Vincent Bonamy.

This text could not have been written without our collaborators who, through their work, greatly contributed to many sections and chapters. We would especially like to thank Gilles Aubert, Xavier Bresson, Tony Chan, Ginmo Chung, Nicolas Forcadel, John Garnett, Peter Jones, Miyoun Jung, Triet Le, Tungyou Lin, Yves Meyer, Jean-Michel Morel, Stanley Osher, Nicolay Tanushev, Ming Yan, among many others.

We also thank Chapman & Hall/CRC Mathematical and Computational

Imaging Sciences Series and its editors Chandrajit Bajaj and Guillermo Sapiro for supporting this project and for giving us the opportunity to contribute to the series with this text.

Finally, we thank our editor, Sunil Nair, for his enormous patience and understanding, his advice and guidance, and for not giving up on the project. Also, we thank his assistants, Rachel Holt, Sarah Morris, Sarah Gelson, Sarfraz Khan, and Alexander Edwards, for their constant interest in the progress of the manuscript and for all their help and support throughout the process. We would also like to express our deep gratitude to Robin Starkes for contributing to the improvement of the writing of the book.
