Founded in 1807, John Wiley & Sons, Inc. has been a valued source of knowledge and understanding for more than 200 years, helping people around the world meet their needs and fulfill their aspirations. Our company is built on a foundation of principles that include responsibility to the communities we serve and where we live and work. In 2008, we launched a Corporate Citizenship Initiative, a global effort to address the environmental, social, economic, and ethical challenges we face in our business. Among the issues we are addressing are carbon impact, paper specifications and procurement, ethical conduct within our business and among our vendors, and community and charitable support. For more information, please visit our website: [www.wiley.com/go/citizenship](http://www.wiley.com/go/citizenship).

# Preface

This textbook is intended for a first course in numerical methods for students in engineering and science, typically taught in the second year of college. The book covers the fundamentals of numerical methods from an applied point of view. It explains the basic ideas behind the various methods and shows their usefulness for solving problems in engineering and science.

In the past, a numerical methods course was essentially mathematical, emphasizing numerical analysis and theory. More recently, due to the availability of powerful desktop computers and computing software that is both affordable and powerful, the content and nature of a first course in numerical methods for engineering and science students are changing. The emphasis is shifting more and more toward applications and toward implementing numerical methods with ready-to-use tools. In a typical course, students still learn the fundamentals of numerical methods. In addition, however, they learn computer programming (or improve their programming skills if they have already been introduced to programming), and use advanced software as a tool for solving problems. MATLAB is a good example of such software. It can be used by students to write their own programs, and can be used as a tool for solving problems using its built-in functions. One of the objectives of a course in numerical methods is to prepare students in science and engineering for future courses in their areas of specialization (and their future careers) where they will have to use computers for solving problems.

## *Main objectives of the book*

To teach the fundamentals of numerical methods, with emphasis on the most essential methods.

To provide students with the opportunity to enhance their programming skills using the MATLAB environment to implement algorithms.

To teach the use of MATLAB as a tool (using its built-in functions) for solving problems in science and engineering, and for checking the results of any programs students write themselves.

### *Features/pedagogy of the book*

- This book is written in simple, clear, and direct language. Frequently, bullets and a list of steps, rather than lengthy text, are used to list facts and details of a specific subject.
- Numerous illustrations are used for explaining the principles of the numerical methods.
- Many of the examples and end-of-chapter problems involve realistic problems in science and engineering.
- MATLAB is integrated within the text and in the examples. A light colored background is used when MATLAB syntax is displayed.
- Annotating comments that explain the commands are posted alongside the MATLAB syntax.
- MATLAB's built-in functions that are associated with the numerical methods are presented in detail.
- The homework problems at the end of the chapters are divided into three groups:
  - (a) **Problems to be solved by hand:** Problems related to improving understanding of numerical methods. In these problems the students are asked to answer questions related to the fundamentals of numerical methods, and to carry out a few steps of the numerical methods by hand.
  - (b) **Problems to be programmed in MATLAB:** Problems designed to provide the opportunity to improve programming skills. In these problems students are asked to use MATLAB to write computer programs (script files and user-defined functions) implementing various numerical methods.
  - (c) **Problems in math, science, and engineering:** Problems in science and engineering that have to be solved by using numerical methods. The objective is to train the students to use numerical methods for solving problems they can expect to see in future courses or in practice. Students are expected to use the programs that are presented in the book, programs that they write, and the built-in functions in MATLAB.

### *Organization of the book*

**Chapter 1:** The first chapter gives a general introduction to numerical methods and to the way that computers store numbers and carry out numerical operations. It also includes a section on errors in numerical solutions and a section on computers and programming.

**Chapter 2:** The second chapter presents a review of fundamental mathematical concepts that are used in the following chapters that cover the numerical methods. It is intended to be used as a reminder, or a refresher, of concepts that the students are assumed (expected) to be

familiar with from their first- and second-year mathematics courses. Since many of these topics are associated with various numerical methods, we feel that it is better to have the mathematical background gathered in one chapter (and easier to find when needed) rather than be dispersed throughout the book. Several of the topics that are covered in Chapter 2 and that are essential in the explanation of a numerical method are repeated in other chapters where the numerical methods are presented. Most instructors will probably choose not to cover Chapter 2 as one unit in the class, but will mention a topic when needed and refer the students to the chapter.

**Chapters 3 through 11:** These nine chapters present the various numerical methods in an order that is typically followed in a first course on numerical methods. These chapters follow the format explained next.

### *Organization of a typical chapter*

An itemized list of the topics that are covered in the chapter is displayed below the title of the chapter. The list is divided into **core** and **complementary** topics. The **core topics** are the most essential topics related to the subject of the chapter. The **complementary topics** include more advanced topics. Obviously, a division of topics related to one subject into core and complementary is subjective. The intent is to help instructors in the design of their course when there is not enough time to cover all the topics. In practicality, the division can be ignored in courses where all the topics are covered.

The first section of the chapter provides a general background with illustrative examples of situations in the sciences and engineering where the methods described in the chapter are used. This section also explains the basic ideas behind the specific class of numerical methods that are described in the chapter. The following sections cover the core topics of the chapter. Next, a special section discusses the built-in functions in MATLAB that implement the numerical methods described in the chapter, and how they may be used to solve problems. The later sections of the chapter cover the complementary topics.

### *The order of topics*

It is probably impossible to write a text book where all the topics follow an order that is agreed upon by all instructors. In the present book, the main subjects are in an order that is typical in a first course in numerical methods. Chapter 3 covers solution of nonlinear equations. It mostly deals with the solution of a single equation, which is a simple application of numerical methods. The chapter also includes, as a complementary topic, a section on the solution of a system of nonlinear equations. Chapter 4 deals with the solution of a system of linear equations. Next, Chapter 5 deals with eigenvalues and eigenvectors, and Chapter 6 covers curve fitting and interpolation. Chapter 7, which is new in the 3rd edition, covers an introduction to Fourier methods. Chapters 8 and 9

cover differentiation and integration, respectively. Finally, solution of ordinary differential equations (ODE) is presented in the last two chapters. Chapter 10 deals with the solution of initial-value problems (first-order, systems, and higher-order) and Chapter 11 considers boundary-value problems.

The order of some of the topics is dictated by the subjects themselves. For example, differentiation and integration need to be covered before ordinary differential equations. It is possible, however, to cover the other subjects in different order than presented in the book. The various chapters and sections in the book are written in a self-contained manner that make it easy for the instructor to cover the subjects in a different order, if desired.

### ***MATLAB programs***

This book contains many MATLAB programs. The programs are clearly identified as user-defined functions, or as script files. All the programs are listed in Appendix B. The programs, or the scripts, are written in a simple way that is easy to follow. The emphasis of these programs is on the basics and on how to program an algorithm of a specific numerical method. Obviously, the programs are not general, and do not cover all possible circumstances when executed. The programs are not written from the perspective of being shortest, fastest, or most efficient. Rather, they are written such that they are easy to follow. It is assumed that most of the students have only limited understanding of MATLAB and programming, and presenting MATLAB in this manner will advance their computing skills. More advanced users of MATLAB are encouraged to write more sophisticated and efficient programs and scripts, and compare their performance with the ones in the book.

### ***Third edition***

The main changes in the third edition are:

**Fourier Methods:** In response to many requests from professors that use the book in their courses, a new chapter (Chapter 7) on Fourier methods has been added to the book. The chapter covers Fourier series, discrete Fourier series, Discrete Fourier Transform, and an introduction to the Fast Fourier Transform (FFT) which are widely used in engineering for processing digital data.

**Eigenvalues and Eigenvectors:** This topic which was part of Chapter 4 (Solving a System of Linear Equations) in the first two editions of the book is now covered in a separate chapter.

**MATLAB:** The third edition of the book is updated to MATLAB R2012b. All the programs use anonymous functions and function handles are used for passing functions into functions. Appendix A has been updated to the current version of MATLAB.

**Homework problems:** About 50% of the problems have been added or changed. Most of the Chapters have 40 or more problems.

**Support material**

The following is available on the instructor companion site at [www.wiley.com/college/gilat](http://www.wiley.com/college/gilat)):

- (a) for faculty who have adopted the text for use in their course, a fully worked solution manual, triple checked for accuracy.
- (b) suggested course syllabi with suggested assignments to help quickly integrate the text into your course.
- (c) conversion guides from other major numerical methods titles to show where each section of your current text is covered in this new text, helping you quickly convert from old to new.
- (d) electronic versions of all the figures and tables from the text, for creating lecture slides and quizzes/exams based on images from the book.
- (e) m-files of all the programs in the text.

Many people have assisted during the preparation of the first two editions of the book. We would like to thank the reviewers and users for the many comments and suggestions they have made.

# Brief Table of Contents

Preface	iii
Chapter 1	<i>Introduction</i> 1
Chapter 2	<i>Mathematical Background</i> 23
Chapter 3	<i>Solving Nonlinear Equations</i> 57
Chapter 4	<i>Solving a System of Linear Equations</i> 99
Chapter 5	<i>Eigenvalues and Eigenvectors</i> 165
Chapter 6	<i>Curve Fitting and Interpolation</i> 193
Chapter 7	<i>Fourier Methods</i> 251
Chapter 8	<i>Numerical Differentiation</i> 303
Chapter 9	<i>Numerical Integration</i> 341
Chapter 10	<i>Ordinary Differential Equations: Initial–Value Problems</i> 385
Chapter 11	<i>Ordinary Differential Equations: Boundary–Value Problems</i> 471
Appendix A	<i>Introductory MATLAB</i> 509
Appendix B	<i>MATLAB Programs</i> 547
Appendix C	<i>Derivation of the Real Discrete Fourier Transform (DFT)</i> 551
Index	555

# Contents

## Preface **iii**

## Chapter 1 *Introduction* **1**

- 1.1 Background **1**
- 1.2 Representation of Numbers on a Computer **4**
- 1.3 Errors in Numerical Solutions **10**
  - 1.3.1 Round-Off Errors **10**
  - 1.3.2 Truncation Errors **13**
  - 1.3.3 Total Error **14**
- 1.4 Computers and Programming **15**
- 1.5 Problems **18**

## Chapter 2 *Mathematical Background* **23**

- 2.1 Background **23**
- 2.2 Concepts from Pre-Calculus and Calculus **24**
- 2.3 Vectors **28**
  - 2.3.1 Operations with Vectors **30**
- 2.4 Matrices and Linear Algebra **32**
  - 2.4.1 Operations with Matrices **33**
  - 2.4.2 Special Matrices **35**
  - 2.4.3 Inverse of a Matrix **36**
  - 2.4.4 Properties of Matrices **37**
  - 2.4.5 Determinant of a Matrix **37**
  - 2.4.6 Cramer's Rule and Solution of a System of Simultaneous Linear Equations **38**
  - 2.4.7 Norms **40**
- 2.5 Ordinary Differential Equations (ODE) **41**
- 2.6 Functions of Two or More Independent Variables **44**
  - 2.6.1 Definition of the Partial Derivative **44**
  - 2.6.2 Chain Rule **45**
  - 2.6.3 The Jacobian **46**
- 2.7 Taylor Series Expansion of Functions **47**
  - 2.7.1 Taylor Series for a Function of One Variable **47**
  - 2.7.2 Taylor Series for a Function of Two Variables **49**
- 2.8 Inner Product and Orthogonality **50**
- 2.9 Problems **51**

7.5 The Discrete Fourier Series and Discrete Fourier Transform	263
7.6 Complex Discrete Fourier Transform	268
7.7 Power (Energy) Spectrum	271
7.8 Aliasing and Nyquist Frequency	272
7.9 Alternative Forms of the Discrete Fourier Transform	278
7.10 Use of MATLAB Built-In Functions for Calculating Discrete Fourier Transform	278
7.11 Leakage and Windowing	284
7.12 Bandwidth and Filters	286
7.13 The Fast Fourier Transform (FFT)	289
7.14 Problems	298

## **Chapter 8**   *Numerical Differentiation*   303

8.1 Background	303
8.2 Finite Difference Approximation of the Derivative	305
8.3 Finite Difference Formulas Using Taylor Series Expansion	310
8.3.1 Finite Difference Formulas of First Derivative	310
8.3.2 Finite Difference Formulas for the Second Derivative	315
8.4 Summary of Finite Difference Formulas for Numerical Differentiation	317
8.5 Differentiation Formulas Using Lagrange Polynomials	319
8.6 Differentiation Using Curve Fitting	320
8.7 Use of MATLAB Built-In Functions for Numerical Differentiation	320
8.8 Richardson's Extrapolation	322
8.9 Error in Numerical Differentiation	325
8.10 Numerical Partial Differentiation	327
8.11 Problems	330

## **Chapter 9**   *Numerical Integration*   341

9.1 Background	341
9.1.1 Overview of Approaches in Numerical Integration	342
9.2 Rectangle and Midpoint Methods	344
9.3 Trapezoidal Method	346
9.3.1 Composite Trapezoidal Method	347
9.4 Simpson's Methods	350
9.4.1 Simpson's 1/3 Method	350
9.4.2 Simpson's 3/8 Method	353
9.5 Gauss Quadrature	355
9.6 Evaluation of Multiple Integrals	360
9.7 Use of MATLAB Built-In Functions for Integration	362
9.8 Estimation of Error in Numerical Integration	364
9.9 Richardson's Extrapolation	366

- 9.10 Romberg Integration **369**
- 9.11 Improper Integrals **372**
  - 9.11.1 Integrals with Singularities **372**
  - 9.11.2 Integrals with Unbounded Limits **373**
- 9.12 Problems **374**

## **Chapter 10 *Ordinary Differential Equations: Initial-Value Problems* 385**

- 10.1 Background **385**
- 10.2 Euler's Methods **390**
  - 10.2.1 Euler's Explicit Method **390**
  - 10.2.2 Analysis of Truncation Error in Euler's Explicit Method **394**
  - 10.2.3 Euler's Implicit Method **398**
- 10.3 Modified Euler's Method **401**
- 10.4 Midpoint Method **404**
- 10.5 Runge–Kutta Methods **405**
  - 10.5.1 Second-Order Runge–Kutta Methods **406**
  - 10.5.2 Third-Order Runge–Kutta Methods **410**
  - 10.5.3 Fourth-Order Runge–Kutta Methods **411**
- 10.6 Multistep Methods **417**
  - 10.6.1 Adams–Bashforth Method **418**
  - 10.6.2 Adams–Moulton Method **419**
- 10.7 Predictor–Corrector Methods **420**
- 10.8 System of First-Order Ordinary Differential Equations **422**
  - 10.8.1 Solving a System of First-Order ODEs Using Euler's Explicit Method **424**
  - 10.8.2 Solving a System of First-Order ODEs Using Second-Order Runge–Kutta Method (Modified Euler Version) **424**
  - 10.8.3 Solving a System of First-Order ODEs Using the Classical Fourth-Order Runge–Kutta Method **431**
- 10.9 Solving a Higher-Order Initial Value Problem **432**
- 10.10 Use of MATLAB Built-In Functions for Solving Initial-Value Problems **437**
  - 10.10.1 Solving a Single First-Order ODE Using MATLAB **438**
  - 10.10.2 Solving a System of First-Order ODEs Using MATLAB **444**
- 10.11 Local Truncation Error in Second-Order Range–Kutta Method **447**
- 10.12 Step Size for Desired Accuracy **448**
- 10.13 Stability **452**
- 10.14 Stiff Ordinary Differential Equations **454**
- 10.15 Problems **457**

## **Chapter 11**   *Ordinary Differential Equations: Boundary-Value Problems*   **471**

- 11.1 Background   **471**
- 11.2 The Shooting Method   **474**
- 11.3 Finite Difference Method   **482**
- 11.4 Use of MATLAB Built-In Functions for Solving Boundary Value Problems   **492**
- 11.5 Error and Stability in Numerical Solution of Boundary Value Problems   **497**
- 11.6 Problems   **499**

## **Appendix A**   *Introductory MATLAB*   **509**

- A.1 Background   **509**
- A.2 Starting with MATLAB   **509**
- A.3 Arrays   **514**
- A.4 Mathematical Operations with Arrays   **519**
- A.5 Script Files   **524**
- A.6 Plotting   **526**
- A.7 User-Defined Functions and Function Files   **528**

- C.2 Determination of the Real DFT   **553**

## **Index**   **555**

## Chapter 1

# Introduction

### Core Topics

Representation of numbers on a computer (1.2).

Computers and programming (1.4).

Errors in numerical solutions, round-off errors and truncation errors (1.3).

## 1.1 BACKGROUND

Numerical methods are mathematical techniques used for solving mathematical problems that cannot be solved or are difficult to solve analytically. An analytical solution is an exact answer in the form of a mathematical expression in terms of the variables associated with the problem that is being solved. A numerical solution is an approximate numerical value (a number) for the solution. Although numerical solutions are an approximation, they can be very accurate. In many numerical methods, the calculations are executed in an iterative manner until a desired accuracy is achieved.

For example, Fig. 1-1 shows a block of mass  $m$  being pulled by a force  $F$  applied at an angle  $\theta$ . By applying equations of equilibrium, the relationship between the force and the angle is given by:

$$F = \frac{\mu mg}{\cos \theta + \mu \sin \theta} \quad (1.1)$$

where  $\mu$  is the friction coefficient and  $g$  is the acceleration due to gravity. For a given value of  $F$ , the angle that is required for moving the block can be determined by solving Eq. (1.1) for  $\theta$ . Equation (1.1), however, cannot be solved analytically for  $\theta$ . Using numerical methods, an approximate solution can be determined for specified accuracy. This means that when the numerical solution for  $\theta$  is substituted back in Eq. (1.1), the value of  $F$  that is obtained from the expression on the right-hand side is not exactly equal to the given value of  $F$ , but is very close.

Numerical techniques for solving mathematical problems were developed and used hundreds and even thousands of years ago. Implementation of the numerical techniques was difficult since the calculations had to be carried out by hand or by use of simple mechanical

**Figure 1-1: Motion of a block on a surface with friction.**

computing devices, which limited the number of calculations that could be carried out, as well as their speed and accuracy. Today numerical methods are used with fast electronic digital computers that make it possible to execute many tedious and repetitive calculations that produce accurate (even though not exact) solutions in a very short time.

### ***Solving a problem in science and engineering***

The process of solving a problem in science and engineering is influenced by the tools (mathematical methods) that are available for solving the problem. The process can be divided into the following steps:

#### ***Problem statement***

The problem statement defines the problem. It gives a description of the problem, lists the variables that are involved, and identifies the constraints in the form of boundary and/or the initial conditions.

#### ***Formulation of the solution***

Formulation of the solution consists of the model (physical law or laws) that is used to represent the problem and the derivation of the governing equations that need to be solved. Examples of such laws are Newton's laws, conservations of mass, and the laws of thermodynamics. The models that are used (chosen) to solve the problem need to be consistent with the methods that are subsequently used for solving the equations. If analytical methods are expected to be used for the solution, the governing equations must be of a type that can be solved analytically. If needed, the formulation has to be simplified, such that the equations could be solved analytically. If numerical methods are used for the solution, the models and the equations can be more complicated. Even then, however, some limitations might exist. For example, if the formulation is such that a numerical solution requires a long computing time, the formulation might have to be simplified such that a solution is obtained in a reasonable time. An example is weather forecasting. The problem that is solved is large, and the numerical models that are used are very complicated. The numerical simulation of the weather, however, cannot outlast the period over which forecasting is needed.

#### ***Programming (of numerical solution)***

If the problem is solved numerically, the numerical method that is used for the solution has to be selected. For every type of mathematical problem there are several (or many) numerical techniques that can be used. The techniques differ in accuracy, length of calculations, and difficulty in programming. Once a numerical method is selected, it is implemented in a computer program. The implementation consists of an ***algorithm***, which is a detailed plan that describes how to carry out the numerical method, and a computer program, which is a list of commands that allows the computer to execute the algorithm to find the solution.

### Interpretation of the solution

Since numerical solutions are an approximation (errors are addressed in Section 1.4), and since the computer program that executes the numerical method might have errors (or bugs), a numerical solution needs to be examined closely. This can be done in several ways, depending on the problem. For example, if the numerical method is used for solving a nonlinear algebraic equation, the validity of the solution can be verified by substituting the solution back in the equation. In more complicated problems, like a solution of a differential equation, the numerical solution can be compared with a known solution of a similar problem, or the problem can be solved several times using different boundary (or initial) conditions, and different numerical methods, and examining the subsequent differences in the solutions.

An illustration of the first two steps in the solution process of a problem is shown in Example 1-1.

#### Example 1-1: Problem formulation

Consider the following problem statement:

A pendulum of mass  $m$  is attached to a rigid rod of length  $L$ , as shown in the figure. The pendulum is displaced from the vertical position such that the angle between the rod and the  $x$  axis is  $\theta_0$ , and then the pendulum is released from rest. Formulate the problem for determining the angle  $\theta$  as a function of time,  $t$ , once the pendulum is released. In the formulation include a damping force that is proportional to the velocity of the pendulum.

Formulate the solution for two cases:

(a)  $\theta_0 = 5^\circ$ , and (b)  $\theta_0 = 90^\circ$ .

#### SOLUTION

##### Physical law

The physical law that is used for solving the problem is Newton's second law of mechanics, according to which, as the pendulum swings back and forth, the sum of the forces that are acting on the mass is equal to the mass times its acceleration.

$$\Sigma \vec{F} = m\vec{a} \quad (1.2)$$

This can be visualized by drawing a free body diagram and a mass acceleration diagram, which are shown on the right. The constant  $c$  is the damping coefficient. It should be pointed out that the mass of the rod is neglected in the present solution.
