纳米科学与纳米技术导论

The maturation of nanotechnology has revealed it to be a unique and distinct discipline rather than a specialization within a larger field. Its textbook cannot afford to be a chemistry, physics, or engineering text focused on nano. It must be an integrated and multidisciplinary nano textbook. The archetype of the modern nano textbook, this text builds a solid background in characterization and fabrication methods while integrating the

Nanotechnology is no longer a subdiscipline of chemistry, engineering, or any other field. It represents the convergence of many fields, and therefore demands a new paradigm for teaching. This textbook is for the next generation of nanotechnologists. It surveys the field's broad landscape, exploring the physical basics such as nanorheology, nanofluidics, and nanomechanics as well as industrial concerns such as manufacturing, reliability, and

工程伦理学

A response of the engineering profession to the challenges of security, poverty and under-development, and environmental sustainability is described. Ethical codes, which govern the behavior of engineers, are examined from a historical perspective linking the prevailing codes to models of the natural world. A new ethical code based on a recently introduced model of Nature as an integral community is provided and discussed.

The text addresses the impact of globalization within engineering, particularly on working practices and prospects for creativity. It suggests that accepted norms of economic activity create enclosures and thresholds within the profession, which—as engineers increase their awareness (reflexivity)—will shape the future of engineering, and the values which underpin it. It is aimed at practicing engineers and those in training and is an
