注：长春台于1976年10月15日中止工作。于1977年元月迁至新址，座标为43°48'05"N, 125°26'54"E, N = 230m, 台基为火山岩和板岩互层。

上海佘山于1976年11月15日迁至新址，座标为31°05'44"N, 121°11'12"E, h = 9.9m, 台基为变质辉绿岩。

南京台于1976年11月中止工作。新台址座标为32°03'06"N, 118°51'16"E, h = 45m。

Changchun seismological station stopped operation on Oct. 15, 1976, and it was moved to a new site at 43°48'05"N and 125°26'54"E, h = 230m.

The foundation of the station is volcanic rock and slate.

On Nov. 15, 1976, the Shanghai seismological station was moved to a new site at 31°05'44"N and 121°11'12"E, h = 9.9m, the foundation of station is metamorphic diabase.

Nanjing seismological station stopped operation in Nov. 1976, and it was moved to a new site at 32°03'06"N and 118°51'16"E, h = 45m

1977年地震活动简况

全球范围地震活动情况

根据中国地震台网观测资料,1977年能够测出震中位置的地震,全球5.5级以上(震级都按Ms标度)共计192次。其中6级以上的有78次,7级以上的15次。有一次震级等于8级,6月22日发生在西南太平洋的汤加群岛地区;另一次震级等于8.1级,8月19日发生在印度尼西亚的松巴哇岛附近。全年地震活动,仍以环太平洋地震带的西半部为主,突出地区有印度尼西亚和新几内亚地区,西南太平洋的萨摩亚和汤加群岛地区,所罗门群岛地区。在伊朗,阿留申群岛,大西洋和南美洲的阿根廷都各发生一次7级以上的大地震,和往年的活动水平相差不大。在北美洲没有6级以上的地震。在罗马尼亚和红海南部出现少有的大地震活动。罗马尼亚于3月4日一次震级等于7的中等深度地震,是本世纪以来这一地区最大的一次地震活动。红海地区于12月28日发生一次7.1级地震,是这一地区少有的大地震活动,也是该区十年来最大的一次,红海地区于1967年3月28日,发生过震级等于6.7的地震($H = 02 - 41 - 33.5, 19.9^{\circ}N, 38.7^{\circ}E$,据USGS)。上述的大地震,都在震中地区造成了不同程度的破坏和伤亡。就地震活动的地区分布来看,和1976年比较,欧亚大陆上的地震活动要弱得多,仅罗马尼亚和伊朗有两次7级以上活动,南北美洲的地震活动也是较弱的。按7级以上的次数统计,和1904年以来的全球年平均次数(18次)比较,总的说来,全球范围1977年的地震活动要弱一些($M \geq 7$ 的共15次),比1976年($M \geq 7$ 共22次)也弱得多。

国内地震活动简况

1977年是我国国内地震活动很弱的年份,不仅比1976年弱得多,与有史以来历年情况比较,也是相当弱的年份。地震活动的主要特点是:总次数较少,最大地震的强度较低,空间分布分散。全年4级以上地震总数为120次,按5级以上的次数统计是33次,1976年为76次,按5.5级以上的统计次数是14次。1976年是34次。其中6至6.6级的只有6次。最大震级6.6,震中在西藏拉萨西北部。青海省在1月份连续发生6.4级和6.3级地震共二次。新疆西部12月份有一次6.2级地震,唐山5月12日一次6.2级较强余震,也是近三年以来(1977至1979年)最大的一次余震。东海地区12月份一次6.5级地震,是这一地区少有的地震活动。在4级以上的120次总数中,包括前一年的几次大地震的余震在内,其中有唐山地区余震22次,四川盐源宁南地区余震10次,云南龙陵潞西的余震7次。全部余震的震级,除唐山地区的6.2外,都小于5.2级。河北邢台和辽宁海城营口地区的4级以下余震活动仍在持续之中。从震中的地理分布情况来看(详见“中国地震震中分布图”),一年中虽然震级都不大,但各地区在各个地震带上都有零星小地震活动,和1976年的震中分布情况比较,形成鲜明的对照。1976年的地震强烈,大小地震都集中在五、六个局部地点,在大面积上的活动则十分稀疏(参阅1976年的震中分布图)。另外,我国东部地区,河北省磁县3月10日一次4级,江苏溧阳5月10日一次4.1级,山东成武7月9日一次4.1级。广西壮族自治区平果县10月19日一天中连续二次,先是5.0级,后是4.2级,当地有破坏。

A Brief Review of Seismic Activity in 1977

The Seismic Activity of the world

Using the observed data of the Chinese seismological station network, in 1977, the epicentral locations of 192 earthquakes with $M \geq 5.5$ (magnitude scale Ms is used) have been determined, among them 78 earthquakes with $M \geq 6.0$, 15 with $M \geq 7.0$, one with $M = 8$, which occurred on June 22 in Tonga Islands of the Southwest Pacific Ocean; the other with $M = 8.1$, which occurred on August 19 near the Sunbawa Island of Indonesia. Most earthquakes of the year were still distributed along the western half of the Circum-Pacific seismic belt, particularly in the regions of Indonesia-New Guinea, Samoa-Tonga Islands and Solomon Islands. Some major shocks with $M = 7 \sim 7.9$ occurred in Iran, Aleutian Islands, the Atlantic Ocean, and Argentina of South America, whose seismic level was not greatly different from that in the past years. In North America no earthquake with magnitude greater than 6 has been recorded. In Romania and the southern part of the Red Sea, unusually large shocks occurred. An intermediate depth earthquake with $M = 7.0$, occurred on March 4, which was the greatest earthquake in the region since the beginning of this century. In the Red Sea region an earthquake with $M = 7.1$ occurred on December 28 which was both a great earthquake rarely occurred in history and the greatest one in ten years within this region. On March 28, 1967 an earthquake with $M = 6.7$ occurred in the Red Sea region ($H = 02h41m33.5s$, 19.9°N , 38.7°E , according to USGS). The above mentioned major earthquakes caused different degrees of damages and casualties in the epicentral regions. Comparing with 1976 the seismic activity of the Eurasia Continent was much lower in view of its regional distributions. Only two earthquakes with magnitude greater than 7 occurred in Romania and Iran. The seismic activities of South and North America are low too. Statistically for earthquakes with magnitude above 7, the annual average number of 1977 compared with that of the whole world since 1904 which is 18 in number, the world-wide seismic activity in 1977 (15 for $M \geq 7$) is lower while much lower than in 1976 (22 for $M \geq 7$).

The Seismic Activity of China

The year 1977 was the year in which the seismic activity was very low in China. It was not only much lower than the year 1976, but also relatively lower than in past years and in history. Its main features are as follows: total number of earthquakes was less, the magnitude of the largest earthquake, lower and the geographic distribution scattered. Total number of the earthquakes with $M \geq 4$ in 1977 was 120, in which 33 for $M \geq 5$, while 76 for 1976, 14 for $M \geq 5.5$, while 34 for 1976. Only 6 earthquakes of magnitudes $6 \leq M \leq 6.6$ occurred, and the maximum magnitude was 6.6, the epicenter of which was located northwest of Lhasa in Xizang. In the Qinghai Province two earthquakes with $M = 6.4$ and $M = 6.3$ occurred in January successively and in December an earthquake of magnitude 6.2 occurred in western Xinjiang. A strong aftershock with $M = 6.2$ occurred on May 12 in the Tangshan Earthquake region which was the largest aftershock for the last three years (1977-1979). In the East China Sea an earthquake with $M = 6.5$ occurred in December, a rare event for this region. Among the total of 120 shocks with $M \geq 4$, there are aftershocks of several major shocks of the preceding year including 22 aftershocks of the Tangshan Earthquake, 10 aftershock of the Yanyuan-Ninglang Yizu Zizhixian (Yanyuan-Ninglang, Autonomous County of Yi Nationality) Earthquake, Sichuan Province and 7 aftershocks of the Longling-Luxi Earthquake, Yunnan Province. The magnitudes of all these aftershocks with the exception of the Tangshan aftershock with $M = 6.2$, are smaller than 5.2. The aftershock activities with $M < 4$ in the Xingtai area of Hebei Province and the Haicheng-Yingkou region of Liaoning Province are still going on. From the geographical distribution of epicenters (See Map of Epicentral Distribution of Earthquakes in China), in every region and on all seismic belts there were sporadic weak seismic activities during 1977, a sharp contrast in comparison with the year 1976. In 1976 the seismic activities were strong, concentrated in 5-6 local areas, and sparsely distributed in other areas. (See Epicentral Distribution of Earthquakes in China, 1976). Besides, in East China several events took place during 1977, namely, on March 10, a shock, $M = 4$ in Ci Xian of Hebei Province; on May 10, $M = 4.1$, in Liyang of Jiangsu Province; on July 9, $M = 4.1$, in Chengwu of Shandong Province; on October 19, two successive shocks with $M = 5$ and $M = 4.2$, in Pingguo County, Guangxi Province, causing some damages in the epicentral area.
