出版前言

我们的大学生、研究生毕业后,面临的将是一个国际化的信息 时代。他们将需要随时查阅大量的外文资料;会有更多的机会参 加国际性学术交流活动;接待外国学者;走上国际会议的讲坛。作 为科技工作者,他们不仅应有与国外同行进行口头和书面交流的 能力, 更为重要的是, 他们必须具备极强的查阅外文资料获取信息 的能力。有鉴于此,在国家教委所颁布的"大学英语教学大纲"中 有一条规定,专业阅读应作为必修课程开设。同时,在大纲中还规 定了这门课程的学时和教学要求。有些高校除开设"专业阅读"课 之外,还在某些专业课拟进行英语授课。但教、学双方都苦于没有 一定数量的合适的英文原版教材作为教学参考书。为满足这方面 的需要,我们挑选了7本计算机科学方面最新版本的教材,进行影 印出版。首批影印出版的6本书受到广大读者的热情欢迎,我们 深受鼓舞,今后还将陆续推出新书。希望读者继续给予大力支持。 Prentice Hall 公司和清华大学出版社这次合作将国际先进水平的 教材引入我国高等学校,为师生们提供了教学用书,相信会对高校 教材改革产生积极的影响。

Preface

Introduction

Network programming involves writing programs that communicate with other programs across a computer network. One program is normally called the *client* and the other the *server*. Most operating systems provide precompiled programs that communicate across a network—common examples in the TCP/IP world are Web clients (browsers) and Web servers, and the FTP and Telnet clients and servers—but this book describes how to write our own network programs.

We write network programs using an application program interface or API. We describe two APIs for network programming:

- sockets, sometimes called "Berkeley sockets" acknowledging their heritage from Berkeley Unix, and
- XTI (X/Open Transport Interface), a slight modification of the Transport Layer Interface (TLI) developed by AT&T.

All the examples in the text are from the Unix operating system, although the foundation and concepts required for network programming are, to a large degree, operating system independent. The examples are also based on the TCP/IP protocol suite, both IP versions 4 and 6.

To write network programs one must understand the underlying operating system and the underlying networking protocols. This book builds on the foundation of the my other four books in these two areas, and these books are abbreviated throughout this text as follows:

- APUE: Advanced Programming in the UNIX Environment [Stevens 1992],
- TCPv1: TCP/IP Illustrated, Volume 1 [Stevens 1994],
- TCPv2: TCP/IP Illustrated, Volume 2 [Wright and Stevens 1995], and
- TCPv3: TCP/IP Illustrated, Volume 3 [Stevens 1996].

This second edition of *UNIX Network Programming* still contains information on both Unix and the TCP/IP protocols, but many references are made to these other four texts to allow interested readers to obtain more detailed information on various topics. This is especially the case for TCPv2, which describes and presents the actual 4.4BSD implementation of the network programming functions for the sockets API (socket, bind, connect, and so on). If one understands the implementation of a feature, the use of that feature in an application makes more sense.

Changes from the First Edition

This second edition is a complete rewrite of the first edition. These changes have been driven by the feedback I have received teaching this material about once a month during 1990–1996, and by following certain Usenet newsgroups during this same time, which lets one see the topics that are continually misunderstood. The following are the major changes with this new edition:

- This new edition uses ANSI C for all examples.
- The old Chapters 6 ("Berkeley Sockets") and 8 ("Library Routines") have been
 expanded into 25 chapters. Indeed this sevenfold expansion (based on a word
 count) of this material is probably the most significant change from the first to
 the second edition. Most of the individual sections in the old Chapter 6 have
 been expanded into an entire chapter with more examples added.
- The TCP and UDP portions from the old Chapter 6 have been separated and we
 now cover the TCP functions and a complete TCP client-server, followed by the
 UDP functions and a complete UDP client-server. This is easier for newcomers
 to understand than describing all the details of the connect function, for example, with its different semantics for TCP versus UDP.
- The old Chapter 7 ("System V Transport Layer Interface") has been expanded into seven chapters. We also cover the newer XTI instead of the TLI that it replaces.
- The old Chapter 2 ("The Unix Model") is gone. This chapter provided an overview of the Unix system in about 75 pages. In 1990 this chapter was needed because few books existed that adequately described the basic Unix programming interface, especially the differences between the Berkeley and System V implementations that existed in 1990. Today, however, more readers have a fundamental understanding of Unix, so concepts such as a process ID, password files, directories, and group IDs, need not be repeated. (My APUE book is a 700-page expansion of this material for readers desiring additional Unix programming details.)

xvii

Some of the advanced topics from the old Chapter 2 are covered in this new edition, but their coverage is moved to where the feature is used. For example, when showing our first concurrent server (Section 4.8) we cover the fork function. When we describe how to handle the SIGCHLD signal with our concurrent server (Section 5.9), we describe many additional features of Posix signal handling (zombies, interrupted system calls, etc.).

Whenever possible this text describes the Posix interface. (We say more about the Posix family of standards in Section 1.10.) This includes not only the Posix.1 standard for the basic Unix functions (process control, signals, etc.), but also the forthcoming Posix.1g standard for the sockets and XTI networking APIs, and the 1996 Posix.1 standard for threads.

The term "system call" has been changed to "function" when describing functions such as socket and connect. This follows the Posix convention that the distinction between a system call and a library function is an implementation detail that is often irrelevant for a programmer.

The old Chapters 4 ("A Network Primer") and 5 ("Communication Protocols") have been replaced with Appendix A covering IP versions 4 (IPv4) and 6 (IPv6), and Chapter 2 covering TCP and UDP. This new material focuses on the protocol issues that network programmers are certain to encounter. The coverage of IPv6 was included, even though IPv6 implementations are just starting to appear, since during the lifetime of this text IPv6 will probably become the predominant networking protocol.

I have found when teaching network programming that about 80% of all network programming problems have nothing to do with network programming, per se. That is, the problems are not with the API functions such as accept and select, but the problems arise from a lack of understanding of the underlying network protocols. For example, I have found that once a student understands TCP's three-way handshake and four-packet connection termination, many network programming problems are immediately understood.

The old sections on XNS, SNA, NetBIOS, the OSI protocols, and UUCP have been removed, since it has become obvious during the early 1990s that these proprietary protocols have been eclipsed by the TCP/IP protocols. (UUCP is still popular and is not proprietary, but there is little we can show from a network programming perspective using UUCP.)

- The following new topics are covered in this second edition:
 - IPv4/IPv6 interoperability (Chapter 10),
 - protocol-independent name translation (Chapter 11),
 - routing sockets (Chapter 17),
 - multicasting (Chapter 19),
 - threads (Chapter 23),
 - IP options (Chapter 24),
 - datalink access (Chapter 26),

- client–server design alternatives (Chapter 27),
- · virtual networks and tunneling (Appendix B), and
- network program debugging techniques (Appendix C).

Unfortunately, the coverage of the material from the first edition has been expanded so much that it no longer fits into a single book. Therefore at least two additional volumes are planned in the UNIX Network Programming series.

- Volume 2 will probably be subtitled IPC: Interprocess Communication and will be an expansion of the old Chapter 3, along with coverage of the 1996 Posix.1 realtime IPC mechanisms.
- Volume 3 will probably be subtitled Applications and will be an expansion of Chapters 9-18 of the first edition.

Even though most of the networking applications will be covered in Volume 3, a few special applications are covered in this volume: Ping, Traceroute, and inetd.

Readers

This text can be used as either a tutorial on network programming, or as a reference for experienced programmers. When used as a tutorial or for an introductory class on network programming, the emphasis should be on Part 2 ("Elementary Sockets," Chapters 3 through 9) followed by whatever additional topics are of interest. Part 2 covers the basic socket functions, for both TCP and UDP, along with I/O multiplexing, socket options, and basic name and address conversions. Chapter 1 should be read by all readers, especially Section 1.4, which describes some wrapper functions used throughout the text. Chapter 2 and perhaps Appendix A should be referred to as necessary, depending on the reader's background. Most of the chapters in Part 3 ("Advanced Sockets") can be read independently of the others in that part.

To aid in the use as a reference, a thorough index is provided, along with summaries on the end papers of where to find detailed descriptions of all the functions and structures. To help those reading topics in a random order, numerous references to related topics are provided throughout the text.

Although the sockets API has become the de facto standard for network programming, XTI is still used, sometimes with protocol suites other than TCP/IP. While the coverage of XTI in Part 4 is smaller than the coverage of sockets in Parts 2 and 3, much of the sockets coverage describes concepts that apply to XTI as well as sockets. For example, all of the concepts regarding the use of nonblocking I/O, broadcasting, multicasting, signal-driven I/O, out-of-band data, and threads, are the same, regardless of which API (sockets or XTI) is used. Indeed, many network programming problems are fundamentally similar, independent of whether the program is written using sockets or XTI, and there is hardly anything that can be done with one API that cannot be done with other. The concepts are the same—just the function names and arguments change.

xix

Source Code and Errata Availability

The source code for all the examples that appear in the book is available from ftp://ftp.kohala.com/pub/rstevens/unpv12e.tar.gz. The best way to learn network programming is to take these programs, modify them, and enhance them. Actually writing code of this form is the *only* way to reinforce the concepts and techniques. Numerous exercises are also provided at the end of each chapter, and most answers are provided in Appendix E.

A current errata for the book is also available from my home page, listed at the end of the Preface.

Acknowleagments

Supporting every author is an understanding family, or nothing would ever get written! I am grateful to my family, Sally, Bill, Ellen, and David, first for their support and understanding when I wrote my first book (the first edition of this book), and for enduring this "small" revision. Their love, support, and encouragement helped make this book possible.

Numerous reviewers provided invaluable feedback (totaling 190 printed pages or 70,000 words), catching lots of errors, pointing out areas that needed more explanation, and suggesting alternative presentations, wording, and coding: Ragnvald Blindheim, Jim Bound, Gavin Bowe, Allen Briggs, Joe Doupnik, Wu-chang Feng, Bill Fenner, Bob Friesenhahn, Andrew Gierth, Wayne Hathaway, Kent Hofer, Sugih Jamin, Scott Johnson, Rick Jones, Mukesh Kacker, Marc Lampo, Marty Leisner, Jack McCann, Craig Metz, Bob Nelson, Evi Nemeth, John C. Noble, Steve Rago, Jim Reid, Chung-Shang Shao, Ian Lance Taylor, Ron Taylor, Andreas Terzis, and Dave Thaler. A special thanks to Sugih Jamin and his students in EECS 489 ("Computer Networks") at the University of Michigan who beta tested an early draft of the manuscript during the spring of 1997.

The following people answered email questions of mine, sometimes lots of questions, which improved the accuracy and presentation of the text: Dave Butenhof, Dave Hanson, Jim Hogue, Mukesh Kacker, Brian Kernighan, Vern Paxson, Steve Rago, Dennis Ritchie, Steve Summit, Paul Vixie, John Wait, Steve Wise, and Gary Wright.

A special thanks to Larry Rafsky and the wonderful team at Gari Software for handling lots of details and for many interesting technical discussions. Thank you, Larry, for everything.

Numerous individuals and their organizations went beyond the normal call of duty to provide either a loaner system, software, or access to a system, all of which were used to test some of the examples in the text.

- Meg McRoberts of SCO provided the latest releases of UnixWare, and Dion Johnson, Yasmin Kureshi, Michael Townsend, and Brian Ziel, provided support and answered questions.
- Mukesh Kacker of SunSoft provided access to a beta version of Solaris 2.6 and answered many questions about the Solaris TCP/IP implementation.

- Jim Bound, Matt Thomas, Mary Clouter, and Barb Glover of Digital Equipment Corp. provided an Alpha system and access to the latest IPv6 kits for Digital Unix.
- Michael Johnson of Red Hat Software provided the latest releases of Red Hat Linux
- Steve Wise and Jessie Haug of IBM Austin provided an RS/6000 system and access to the latest IPv6 for AIX.
- Rick Jones of Hewlett-Packard provided access to a beta version of HP-UX 10.30 and he and William Gilliam answered many questions about it.

Many people helped with the Internet connectivity used throughout the text. My thanks once again to the National Optical Astronomy Observatories (NOAO), Sidney Wolff, Richard Wolff, and Steve Grandi, for providing access to their networks and hosts. Dave Siegel, Justis Addis, and Paul Lucchina answered many questions, Phil Kaslo and Jim Davis provided an MBone connection, Ran Atkinson and Pedro Marques provided a 6bone connection, and Craig Metz provided lots of DNS help.

The staff at Prentice Hall, especially my editor Mary Franz, along with Noreen Regina, Sophie Papanikolaou, and Eileen Clark, have been a wonderful asset to a writer.

Many thanks for letting me do so many things "my way."

As usual, but contrary to popular fads, I produced camera-ready copy of the book using the wonderful Groff package written by James Clark. I typed in all 291,972 words using the vi editor, created the 201 illustrations using the gpic program (using many of Gary Wright's macros), produced the 81 tables using the gtbl program, performed all the indexing, and did the final page layout. Dave Hanson's loom program and some scripts by Gary Wright were used to include the source code in the book. A set of awk scripts written by Jon Bentley and Brian Kernighan helped in producing the final index.

I welcome electronic mail from any readers with comments, suggestions, or bug

fixes.

Tucson, Arizona September 1997 W. Richard Stevens rstevens@kohala.com http://www.kohala.com/~rstevens

7.1 7.2 7.3 7.4 7.5 7.6 7.7 7.8 7.9 7.10 7.11 Chapter 8. 8.1 8.2 8.3 8.4 8.5 8.6	Introduction 177 getsockopt and setsockopt Functions 178 Checking If an Option Is Supported and Obtaining the Default Socket States 183 Generic Socket Options 183 IPv4 Socket Options 197 ICMPv6 Socket Option 199 IPv6 Socket Options 199 TCP Socket Options 201 fcnt1 Function 205 Summary 207 Elementary UDP Sockets Introduction 211 recvfrom and sendto Functions 212 UDP Echo Server: main Function 213 UDP Echo Server: dg_echo Function 214 UDP Echo Client: main Function 216 UDP Echo Client: dg_cli Function 217	178

8.11 8.12 8.13 8.14 8.15 8.16	connect Function with UDP 224 dg_cli Function (Revisited) 227 Lack of Flow Control with UDP 228 Determining Outgoing Interface with UDP 231 TCP and UDP Echo Server Using select 233 Summary 235	
Chapter 9.	Elementary Name and Address Conversions	237
9.1 9.2 9.3 9.4 9.5 9.6 9.7 9.8 9.9 9.10	Introduction 237 Domain Name System 237 gethostbyname Function 240 RES_USE_INET6 Resolver Option 245 gethostbyname2 Function and IPv6 Support 246 gethostbyaddr Function 248 uname Function 249 gethostname Function 250 getservbyname and getservbyport Functions 251 Other Networking Information 255 Summary 256	
Part 3. Ad	Ivanced Sockets	259
Chapter 10.	IPv4 and IPv6 Interoperability	261
•	Introduction 261	
10.1 10.2	IPv4 Client, IPv6 Server 262	
10.3	1Pv6 Client, IPv4 Server 265	
10.4	IPv6 Address Testing Macros 267	
10.5	IPV6_ADDRFORM Socket Option 268	
10.6	Source Code Portability 270	
10.7	Summary 271	
Chapter 11.	Advanced Name and Address Conversions	273
11.1	Introduction 273	
11.2	getaddrinfo Function 273	
11.3	gai_strerror Function 278	
11.4	freeaddrinfo Function 279	
11.5	getaddillito i diodon. II vo and onin o onin	
11.6	getaddrinfo Function: Examples 282 host_serv Function 284	
11.7 11.8	tcp_connect Function 285	
11.9	tcp_listen Function 288	
11.10	udp_client Function 293	
11.11	udp_connect Function 295	
11.12	udp_server Function 296	
11.13	getnameinfo Function 298	
11.14	Reentrant Functions 300	
11.15	gethostbyname_r and gethostbyaddr_r Functions	303

11.16 11.17	Implementation of getaddrinfo and getnameinfo Functions Summary 328	305
Chapter 12.	Daemon Processes and inetd Superserver	331
12.1	Introduction 331	
12.2	syslogd Daemon 332	
12.3	syslog Function 333	
12.4	daemon_init Function 335	
12.5	inetd Daemon 339	
12.6	daemon_inetd Function 344	
12.7	Summary 346	
Chapter 13.	Advanced I/O Functions	349
13.1	Introduction 349	
13.2	Socket Timeouts 349	
13.3	recv and send Functions 354	
13.4	ready and writev Functions 357	
13.5	recymsg and sendmsg Functions 358	
13.6	Ancillary Data 362	
13.7	How Much Data Is Queued? 365	
13.8	Sockets and Standard I/O 366	
13.9	T/TCP: TCP for Transactions 369	
13.10	Summary 371	
Chapter 14.	Unix Domain Protocols	373
14.1	Introduction 373	
14.2	Unix Domain Socket Address Structure 374	
14.3	socketpair Function 376	
14.4	Socket Functions 377	
14.5	Unix Domain Stream Client-Server 378	
14.6	Unix Domain Datagram Client-Server 379	
14.7	Passing Descriptors 381	
14.8	Receiving Sender Credentials 390	
	•	
14.9	Summary 394	
14.9 Chapter 15.	•	397
	Summary 394 Nonblocking I/O Introduction 397	
Chapter 15.	Summary 394 Nonblocking I/O	397 399
Chapter 15.	Summary 394 Nonblocking I/O Introduction 397 Nonblocking Reads and Writes: str_cli Function (Revisited) Nonblocking connect 409	
Chapter 15. 15.1 15.2	Nonblocking I/O Introduction 397 Nonblocking Reads and Writes: str_cli Function (Revisited) Nonblocking connect 409 Nonblocking connect: Daytime Client 410	
Chapter 15. 15.1 15.2 15.3	Nonblocking I/O Introduction 397 Nonblocking Reads and Writes: str_cli Function (Revisited) Nonblocking connect 409 Nonblocking connect: Daytime Client 410 Nonblocking connect: Web Client 413	
Chapter 15. 15.1 15.2 15.3 15.4 15.5 15.6	Nonblocking I/O Introduction 397 Nonblocking Reads and Writes: str_cli Function (Revisited) Nonblocking connect 409 Nonblocking connect: Daytime Client 410 Nonblocking connect: Web Client 413 Nonblocking accept 422	
Chapter 15. 15.1 15.2 15.3 15.4 15.5	Nonblocking I/O Introduction 397 Nonblocking Reads and Writes: str_cli Function (Revisited) Nonblocking connect 409 Nonblocking connect: Daytime Client 410 Nonblocking connect: Web Client 413	
Chapter 15. 15.1 15.2 15.3 15.4 15.5 15.6	Nonblocking I/O Introduction 397 Nonblocking Reads and Writes: str_cli Function (Revisited) Nonblocking connect 409 Nonblocking connect: Daytime Client 410 Nonblocking connect: Web Client 413 Nonblocking accept 422	
Chapter 15. 15.1 15.2 15.3 15.4 15.5 15.6 15.7	Summary 394 Nonblocking I/O Introduction 397 Nonblocking Reads and Writes: str_cli Function (Revisited) Nonblocking connect 409 Nonblocking connect: Daytime Client 410 Nonblocking connect: Web Client 413 Nonblocking accept 422 Summary 424	399
Chapter 15. 15.1 15.2 15.3 15.4 15.5 15.6 15.7 Chapter 16.	Nonblocking I/O Introduction 397 Nonblocking Reads and Writes: str_cli Function (Revisited) Nonblocking connect 409 Nonblocking connect: Daytime Client 410 Nonblocking connect: Web Client 413 Nonblocking accept 422 Summary 424 ioctl Operations	399
Chapter 15. 15.1 15.2 15.3 15.4 15.5 15.6 15.7 Chapter 16.	Nonblocking I/O Introduction 397 Nonblocking Reads and Writes: str_cli Function (Revisited) Nonblocking connect 409 Nonblocking connect: Daytime Client 410 Nonblocking connect: Web Client 413 Nonblocking accept 422 Summary 424 ioctl Operations Introduction 425	399

20.9

Summary 562

16.4 16.5 16.6 16.7 16.8 16.9 16.10	File Operations 427 Interface Configuration 428 get_ifi_info Function 429 Interface Operations 439 ARP Cache Operations 440 Routing Table Operations 442 Summary 443	
Chapter 17.	Routing Sockets	445
17.1 17.2 17.3 17.4 17.5 17.6	Introduction 445 Datalink Socket Address Structure 446 Reading and Writing 447 sysct1 Operations 454 get_ifi_info Function 459 Interface Name and Index Functions 463 Summary 467	
Chapter 18.	Broadcasting	469
18.1 18.2 18.3 18.4 18.5 18.6	Introduction 469 Broadcast Addresses 470 Unicast versus Broadcast 472 dg_cli Function Using Broadcasting 475 Race Conditions 478 Summary 486	
Chapter 19.	Multicasting	487
19.1 19.2 19.3 19.4 19.5 19.6 19.7 19.8 19.9 19.10 19.11	Introduction 487 Multicast Addresses 487 Multicasting versus Broadcasting on A LAN 490 Multicasting on a WAN 493 Multicast Socket Options 495 mcast_join and Related Functions 499 dg_cli Function Using Multicasting 502 Receiving MBone Session Announcements 504 Sending and Receiving 507 SNTP: Simple Network Time Protocol 510 SNTP (Continued) 515 Summary 528	
Chapter 20.	Advanced UDP Sockets	531
20.1 20.2 20.3 20.4 20.5 20.6 20.7 20.8	Introduction 531 Receiving Flags, Destination IP Address, and Interface Index Datagram Truncation 539 When to Use UDP Instead Of TCP 539 Adding Reliability to a UDP Application 542 Binding Interface Addresses 553 Concurrent UDP Servers 557 IPv6 Packet Information 560	532
