ABOUT THIS BOOK

Origins

This book is essentially the reproduction of the Author's Doctoral Thesis which was the result of work carried out between 1982 and 1985 at London University to investigate the applicability of knowledge based techniques to VLSI Computer Aided Design. Owing to the current strong interest in the question of how knowledge based techniques could be applied to VLSI CAD, it was suggested that the thesis should be reproduced for a wider audience.

How it was produced

The original Doctoral thesis was produced at London University using the Ded text editor running under UNIX on a DEC PDP11/44. The work was later transferred electronically to Cambridge University where the book and illustrations were produced with the aid of a Macintosh personal computer supporting Microsoft Word and MacDraw. The completed text was transferred onto magnetic tape.

"I put the words down and push them a bit"
Evelyn Waugh

Acknowledgements

The author wishes to express his appreciation to all those people who supported and assisted him in producing this work including: Linda Bowns, Desmond Holden, Peter Robinson (and the others).

Author's present address

APPENDICES

A1 Knowledge Based Techniques Applied To Design Rule Checking

- A1.1 Introduction
- A1.2 The knowledge based part of the project
- A1.3 Motivation for the techniques described
- A1.4 Description of the proposed DRC system
- A1.5 Elaboration of each part of the DRC system
 - A1.5.1 The global database (GD)
 - A1.5.2 The scan director (SD)
 - A1.5.3 The contextual mask (CM)
 - A1.5.4 The anomaly detector (AD)
 - A1.5.5 The anomaly handler (AH)
 - A1.5.6 The local database (LD)
 - A1.5.7 The design rule file (DRF)
 - A1.5.8 The user interface (UI)
- A1.6 Comments and observations

A2 Samples of LISP Functions Written for the Experimental Work

- A2.1 Enhancements to the basic LISP functions
- A2.2 Frame manipulation functions
- A2.3 Pattern matching functions
- A2.4 Rule handling functions
- A2.5 Demon handling functions
- A2.6 Housekeeping and debugging functions
- A2.7 Table handling functions
- A2.8 Other functions
- A2.9 List of rules and demons used
 - A2.9.1 Demonsets for filling in coordinates of rectangles which are not connected to any other rectangle
 - A2.9.2 Demonsets for calculating the coordinate values of two rectangles which are connected
 - A2.9.3 Demonsets for calculating the coordinate values of super-imposed rectangles (as in contact)
 - A2.9.4 Demonsets for filling in the coordinate values of rectangles which are within complex objects such as transistors
 - A2.9.5 Rules used during the instantiation of single rectangles and devices
 - A2.9.6 Rules concerned with connecting rectangles together

A3 Recommended Books

LIST OF ILLUSTRATIONS

- 1.1 An illustration of a situation modelled symbolically.
- 1.2 An example of a PROLOG program.
- 2.1 Examples of rules.
- 2.2 An extract from an expert system for diagnosing faults in PA amplifiers.
- 2.3 Modelling a circuit using LISP.
- 3.1 The structure of a knowledge based system.
- 4.1 Using frames for reducing complexity in circuit representation.
- 5.1 Illustrating VLSI design as a series of transformations.
- 5.2 An example of the CIF layout representation language.
- 5.3 An example of the SCALE representation and synthesis language.
- 5.4 The stages of silicon compilation.
- 5.5 An example of an ELLA program.
- 5.6 Illustrating the gate-matrix technique.
- 5.7 Design rules for an enhancement transistor.
- 6.1 The growth of integrated circuit complexity.
- 6.2 The schematic and 'sticks' level representation of a NAND gate.
- 6.3 The 'symbolic' level representation of a NAND gate.
- 6.4 The layout level representation of a NAND gate (not to scale).
- 7.1 The frame description for the stick diagram of fig. 6.2.
- 7.2 The frame description for the symbolic diagram of fig. 6.3.
- 7.3 The frame description for the layout diagram of fig. 6.4.
- 7.4 Examples of rules and demons concerned with rectangle placement.
- 7.5 Illustrating the convention adopted for stick diagram notation.
- 7.6 Illustrating an early experiment to calculate layout coordinate values for a PLA.
- 7.7 Examples of relationships between neighbouring rectangles.
- 7.8 The PLA used in the extraction of a functional description.
- 7.9 Examples of the representation of parts of the PLA.
- 7.10 Examples of some intermediate results prior to their functional reduction.
- 8.1 The LOOPS class 'SymbolicDepletionTr'.
- 8.2 The LOOPS object inheritance network for variables and methods.

- 8.3 The LOOPS ruleset concerned with connecting a symbolic transistor to its neighbour.
- 8.4 The LOOPS class 'StickDiagram'.
- 8.5 The LOOPS class 'Stick'.
- 8.6 The LOOPS ruleset concerned with determining the value of the 'Orientation' instance variable of a symbolic transistor.
- 8.7 The LOOPS class 'TaskOrderSO'.
- 9.1 Palladio: Illustrating structure sharing in systems.
- 9.2 Palladio: The interrelation of different design metaphors.
- 11.1 Illustrating the effort required during the development of some early knowledge based systems.
- 12.1 Modelling design as a search through a space of implementation options.
- A1.1 Illustrating design rules.
- A1.2 The structure of the proposed design rule checker.
- A1.3 The hierarchy and sequence of checking rules.
- A1.4 Examples of possible anomalies detected within the context of a diffusion width check.

PREFACE

The motivations for this work

During a panel session at the 1985 International Joint Conference on Artificial Intelligence, held in Los Angeles, one of the panelists humourously suggested that Artificial Intelligence (AI) bore some resemblance to religious thinking on three bases: first, that of the atheist, who refuses to believe that it has any valid or rational basis whatsoever, and that problems ought to be solved by more down to earth techniques; secondly, that of the agnostic, who, while not entirely suspending disbelief, concedes that the ideas reveal possible benefits; and, finally, that of the worst type of television evangelist whose message is summarised thus: "Send me your money now, have faith and all your problems will disappear tomorrow!"

The following pages have their genesis in the doctoral work carried out by the author. This was directed towards investigating the applicability of AI techniques to those problems confronting the designers of very large scale integrated (VLSI) circuits, who are seeking to put to advantage the steady progress being made in the techniques of silicon fabrication, whereby hundreds of thousands of transistors may be accommodated on one single chip.

In view of the scarcity of knowledge about AI, particularly amongst industrial Computer Aided Design (CAD) designers and managers, and the way in which it is able to cope with modelling very large systems and make decisions about them, it was suggested that the thesis should be modified to make it presentable to a wider audience in the hope that some small benefit would ensue.

The audience and aims of this book

In writing this book, two classes of readers have been considered:

- Managers of VLSI CAD groups in industry who may have heard such terms as 'AI', 'Knowledge Based Systems' (KBS), 'LISP machines' or 'Object Orien-

tated Interactive Programming' and who are asking the question: "Well, what are 'AI techniques' and what do they have to offer me?"

— People who may be embarking upon an investigation of such techniques or on a project based upon AI and who could use the book as a case study in the application of Knowledge Based techniques in a non trivial area. New graduate students are one category of person that immediately comes to mind in this context.

It is also submitted that the material is relevant to the objectives of designers and CAD people apart from those involved in VLSI, since it is as much a study on design as it is on building new VLSI CAD tools. Recognising that there may be readers who are not from VLSI or AI backgrounds, some chapters in this book have been set aside for presenting an introduction to the basic ideas, techniques and problems of these areas.

After reading this work, it is hoped that the reader will be better armed with the background necessary to begin an understanding of which aspects of his particular task may lend themselves to containment and solution within a knowledge based framework.

The bulk of the research on which this book is based was carried out in 1983-84 and in terms of the pace of technological progress in VLSI CAD this is a long time, therefore, many problems and conflicts of attitude described in the book have been resolved. This is particularly true in areas such as behavioural to layout synthesis techniques or 'silicon compilation' in addition to the acceptance and use of behavioural and object languages and even LISP.

It should perhaps be said that for some readers from industrial VLSI backgrounds it may, at first, appear odd to describe as being innovative and unfamiliar some of the ideas and techniques for building VLSI CAD systems contained within this book. However, it was not the object of this research to build a better layout generator, compactor, router or whatever. Instead, the aim was to investigate the feasibility of uniting the hitherto unconnected areas of knowledge based systems, object orientated programming and VLSI CAD techniques and philosophy. In order to do this, well understood and 'solved' tasks in VLSI were used as vehicles upon which to try out KBS ideas. With this in mind, the reasons for the existence of the various contents of the book should be clear.

I have preferred to describe the work under the heading of 'Knowledge Based' rather than 'Artificial Intelligence'. This preference stems from the historical fact that the latter expression has tended to be identified with more established

areas of speech and vision research, that have developed their own very specialised techniques. Knowledge Based Techniques generally refer to a subset of all AI techniques and these are the set used for the VLSI work described here. Although others may disagree, I have also elected to include object orientated programming and modelling under this former heading because of the conceptual similarities that this area and frame-based programming from AI share. They have therefore been used within this interpretation in this book.

The contents of the chapters

The plan of the book is as follows; it is left to the reader to decide which chapters require closer scrutiny and which may be skimmed or even passed over.

- For those readers unfamiliar with KBS techniques, Chapter One provides an introduction to the philosophy of symbolic and other knowledge based representation techniques and the capabilities these offer over more conventional and algorithmic techniques.
- Chapter Two discusses how these principles may be embodied in heuristic 'rules' in order that practical and useful 'expert systems' may be produced. Included also is a description of the important AI language LISP.
- Chapter Three outlines the structure and typical components of a knowledge based system.
- The use of rules, objects and other formalisms for building complex knowledge based constructs and systems is explained in Chapter Four.
- For those readers from a non-VLSI background, Chapter Five provides an introduction of what VLSI design is together with a survey of what the various tasks and problems in VLSI CAD are - including some explanation of how these are solved by conventional means. An outline is given of some of the orthodox representation constructs that have been developed for describing a VLSI circuit in its different forms.

This book is not designed, nor was it ever contemplated, as being a full tutorial, manual or discussion upon either AI or VLSI. It is merely for completeness that the foregoing sections have been included. In so doing, the author seeks to direct a reader from one area into that of another and thereby secure an understanding of the problems and ideas involved. A selection of books giving a more

complete and detailed exposition of these areas will be found in the appendixes.

It is as well to appreciate that there are many tasks in VLSI design which can be approached perfectly well using conventional algorithmically based techniques. No material benefit would be conferred upon commercial users from a knowledge based solution if a conventional one would suffice. KBS's invariably include components based upon a designer's "heuristic" understanding of his work and not upon any sound formal theories. AI for AI's sake is not always a wise commercial move.

- This leads on to Chapter Six which describes, notwithstanding the point above, what design is from a KBS viewpoint and how it can be modelled to useful effect. Outlined is the ability to perceive design as a series of transformations, descending from an initially very abstract statement of requirement ("I want to build a") down through a behavioural specification, circuit diagram and finally, to an exact specification of rectangles on a mask. Included also is a discussion about the types of areas of VLSI design that may profitably lend themselves to solution by knowledge based rather than orthodox techniques.

- In his practical work, the author was motivated by a desire to investigate the feasibility of constructing a high level design language *toolkit* which a designer could employ in the construction of his own system for performing a range of these design transformations. The greater part of this practical research has been embodied in Chapter Seven. It is presented as a case study on how to set about building such a toolkit and how each AI paradigm is applied and integrated. It must be emphasised that building a "real" toolkit is an enormous task and the most the author could do, even by drawing upon the entirety of his research, would be merely to map out the routes to be followed. As vehicles for the development of these techniques, the author concentrated upon the specific tasks of: a) the way in which a sticks or symbolic circuit representation might be transformed to mask layout; and b) the way in which a functional description for a circuit could be extracted from a circuit diagram using these techniques.

However, as this work was progressing, the commercially produced toolkit **LOOPS** appeared. Owing to the far greater number of man-years of development effort invested in **LOOPS** it was a much more complete and usable tool, therefore all experimental work was transferred away from the author's own system and onto **LOOPS**. Chapter Eight describes **LOOPS** and this work.

- Chapter Nine surveys a selection of other knowledge based VLSI CAD work.

-- In addition to LOOPS, other shells and toolkits for constructing knowledge based systems have been commercially developed. Evolving alongside these (predominantly LISP based) languages, is a whole philosophy of interactive, exploratory program design. These techniques, and the machines and systems which support them, may be unfamiliar within some commercial CAD environments therefore a brief survey of these systems is given in Chapter Ten.

-- Chapter Eleven aims to offer further assistance to those commercial CAD managers who may wish to know more about assessing the viability of setting up KBS projects. In this chapter therefore is some material on the applicability of KBS techniques to problems in general.

Finally comes Chapter Twelve. This discusses the material of the foregoing chapters and assesses the future outlook for knowledge based VLSI CAD. Also included is a more speculative look at what the next advances may bring. It also gives some thought on how *intelligent assistants* could be built to help the designer at the very highest levels of design transformation, for example, taking his "I want to build a . ." and then producing a behavioural specification. Achievement of this goal would be of immense value since it seems likely that present research will soon result in commercially viable systems for taking a completed behavioural specification and automatically producing layout.

TABLE OF CONTENTS

About this book	
Preface	xv
1 An Introduction to Knowledge Representation Philosophy and Techniques	
1.1 Introduction	
1.2 Caveat	
1.3 What is a knowledge based system?	2
1.4 The basis of knowledge based representations	2
1.4.1 Representing the world symbolically	3
1.4.2 Inductive inference	4
1.5 PROLOG	6
2 Rules, Rule Based Systems and LISP	9
2.1 Rules	9
2.2 Rule Based Expert Systems	10
2.3 LISP	13
3 The Attributes of Knowledge Based Systems	17
4 Other Important Representational Metaphors for Knowledge Based Programming	23
4.1 Introduction	23
4.2 Frames	23
4.3 Object languages	26
4.3.1 Introduction	26
4.3.2 Traditional problems	26
4.3.3 Differences between object and conventional representation	26

4.3.4	Messages	27
4.3.5	Classes and hierarchies	27
4.3.6	Inheritance	28
4.3.7	Behaviour	28
4.3.8	SIMULA	28
4.4	Actors	29
4.5	Demons	30
4.6	Semantic nets	30
4.7	Procedures	30
4.8	The interrelation of KBS metaphors	30
5	An Introduction to Computer Aided VLSI Design	33
5.1	What is circuit design?	33
5.2	How do computers fit in?	33
5.3	The problems of VLSI design and associated CAD tools	35
5.4	Rational VLSI design	36
5.4.1	Hierarchies and perspectives	36
5.4.2	Using cells	38
5.4.3	A comparison of VLSI and software design techniques	39
5.5	Languages for VLSI representation	39
5.5.1	Basic requirements	39
5.5.2	Caltech Intermediate Form (CIF)	40
5.5.3	SCALE	40
5.5.4	Functional geometry	43
5.6	Conventional layout synthesis tools	43
5.7	Silicon compilers	44
5.7.1	Modelling layout with software	44
5.7.2	Behavioural and structural specification	44
5.7.3	Current status	45
5.7.4	A survey of some silicon compilers	46
5.8	Other tools	49
5.8.1	Geometric layout	49
5.8.2	Symbolic layout	49
5.8.3	Gate matrix	50
5.8.4	Parameterised and algorithmically generated cells	51
5.9	Conventional analysis tools for VLSI	51
5.9.1	Design rule checking	52
5.9.2	Compaction	54
5.9.3	Electrical rule checking	55

5.9.4	Network extraction and comparison	55
5.9.5	Auto routing	55
5.9.6	Simulation	56
6	Knowledge Based Computer Aided Design	61
6.1	Why does VLSI CAD need knowledge based techniques?	61
6.1.1	The VLSI Problem:	61
	Physical potential against design complexity	
6.1.2	Problems of software design	62
6.2	The applicability of knowledge based techniques to CAD	64
6.2.1	Looking at design as a search process	65
6.2.2	Dependencies and constraints	66
6.2.3	Top down and bottom up search techniques	66
6.2.4	The knowledge base	67
6.3	Knowledge based layout synthesis	68
6.4	Acquiring knowledge of the layout problem	69
6.4.1	The types of expert interviewed	69
6.4.2	Problems encountered	69
6.4.3	Reasons for not choosing an existing shell	70
6.5	An analysis of the problem	70
6.5.1	Basic strategies	71
6.5.2	Diagrammatic representation	72
6.5.3	Design rule representation	74
6.5.4	What is success?	75
6.5.5	Improvement and verification of layout	76
7	A Description of the Experiments Leading to the Development of Formalisms and a Language for the Task	77
7.1	The background to the experimental work	77
7.2	Choice of programming language and development environment	79
7.2.1	Conventional imperative languages	79
7.2.2	Symbolic languages (LISP and PROLOG)	80
7.2.3	Higher level languages or KBS toolkits	81
7.3	Initial guiding principles	82
7.3.1	Representation of structures	82
7.3.2	Decision making	83
7.3.3	The conversion from sticks to layout	83
7.3.4	Transformation between stick and symbolic diagrams	86

7.3.5	Transformation from symbolic diagram to layout	88
7.3.6	System building tools	90
7.3.7	User interface	91
7.4	Basic frame notation	91
7.4.1	Transforming a PLA	92
7.4.2	Problems of ambiguity associated with notation	95
7.5	Automatic production of code	96
7.6	Convenient interactive input of descriptions	97
7.7	Rules	98
7.8	Demons	100
7.9	Using rules to select the relevant demons	101
7.10	Blackboards	103
7.11	Teams and managers	105
7.12	The use of algorithms	106
7.13	Rulesets	107
7.14	The control of rule execution	108
7.15	Tasks	109
7.16	Using rules and demons for governing control	111
7.17	Control using agendas	111
7.18	Housekeeping using simple blackboards	112
7.19	Extensions to the task idea	112
7.20	The transformation of a stick diagram to a functional specification	113
7.21	A summary of knowledge gained	118
7.22	The testing of the system and the elimination of errors and inconsistencies	119

8 Using the LOOPS Language for Design and a Review of the Experimental Work 123

8.1	Introduction	123
8.2	LOOPS representational structures	125
8.2.1	Other abilities of LOOPS	128
8.3	The transformation of a stick diagram into a symbolic diagram	129
8.3.1	Transformation steps	130
8.4	Points arising from this program	136
8.4.1	Messages	136
8.4.2	The location and use of methods	137
8.4.3	The declarative aspects of the task and the use of PRO-LOG	137
8.5	A review of the experimental work	138
