# Preface

The study of climate has always been challenging because it draws upon many disciplines. We set out to write a book for undergraduates about the Earth's climate which reflects the various disciplines involved, provides the basic factual information, suggests ways in which this information can be used and indicates where the challenges, and excitement, lie. We have tried to emphasise the importance of climatic information without making its acquisition and understanding seem too daunting. To assist those who are less well acquainted with meteorological and climatological terminology there is a glossary at the end of the book. Information about *Système Internationale* (SI) units is given in an appendix.

People who study or need to be able to understand the climate come from a wide range of backgrounds with a large variety of motives. Indeed, one of the major difficulties which has beset the study of climate has been the naming of the people who do it! Speaking of climatology in 1978 in an address reported in the *Bulletin of the American Meteorological Society* (10, 1171–1174), Professor Kenneth Hare said, '... you hardly heard the word professionally in the 1940s. It was a layman's word. Climatologists were the halt and the lame ... in the British service you actually had to be medically disabled in order to get into the climatological division ... It was clearly not the age of climate. Now it is. It's the respectable thing to do ... This is obviously the decade in which climate is coming into its own.' We hope that this text will encourage our readers in their quest for climatological excellence.

and North Carolina  
(8 November 1984)

# Acknowledgements

There are a great many people who deserve thanks for helping with this book. Not least are our two institutions and our departments and colleagues and Professor Stan Gregory of Sheffield University who started the whole venture. We have both used preliminary versions of the text as lecture notes in undergraduate courses and we thank our ex-students who wittingly and unwittingly helped us. Postgraduates and colleagues have also helped by reading, encouraging and correcting. In particular we should thank Dr Kendal McGuffie for his untiring efforts as unpaid editor, Frances Drake for drafting the glossary and Dr J. Graham Cogley for reading and re-reading all the preliminary efforts. We are also very grateful to Mrs Sandra Mather who did such a marvellous job with the illustrations.

Special thanks are due to Mr L. Dent, Principal Meteorological Officer, Manchester Airport and Mr Kiff at the Meteorological Office Training College at Shinfield, both of whom allowed us to photograph their operational meteorological equipment. The staff at the National Weather Service Forecast Office, Raleigh-Durham Airport and at the National Climatic Data Center, Asheville have unfailingly answered numerous questions with courtesy and wit.

Fortunately we, respectively, married spouses who can add up and integrate and spell and punctuate. For these and all the many efforts Brian and Shirley have made to help us complete this book we are indeed grateful.

We are grateful to the following for permission to reproduce copyright material:

the author, L H Allen and Academic Press for fig 4.25 from figs 46, 48 pp 187, 190 *Descriptive Meteorology* by Willett & Saunders (1959); American Association for the Advancement of Science for figs 7.4(b), 7.5, 7.33 from figs 5, 2, 7 in the article 'Climatic impact of increasing atmospheric carbon dioxide' by J Hansen et al pp 973, 960, 965 *Science* Vol 213 (August 1981) Copyright 1981 by the AAAS, 7.18 from the article 'The Surface of the ice age earth' by T C McIntyre (CLIMAP) p 1132 *Science* Vol 191 (19/3/76) Copyright 1976 by the AAAS; American Chemical Society for fig 6.36 by G E Likens from pp 29-44 *Chemical Engineering News* Vol 54 (22/11/76) Copyright 1976 American Chemical

Society; American Meteorological Society for figs 2.11, 2.12, 6.17 from figs 1, 2, 9 in the article 'A. # List of Symbols

All symbols used to represent constants and variables are defined at their first occurrence in the text. A limited number are used in other textual locations separate from this definition and these are collected here for easy reference.

## Roman

$A$	albedo
$c_p$	specific heat at constant pressure
$C$	specific heat
$C^*$	conductive capacity
$E$	energy
$E^*$	radiant energy
$g$	acceleration
$G$	heat flux into the ground
$H$	sensible heat flux
$K^*$	thermal diffusivity
$K$	thermal conductivity
or $K$	solar radiation ( $K \downarrow$ = downward, $K \uparrow$ = upward)
$L$	longwave (terrestrial) radiation ( $L \downarrow$ = downward, $L \uparrow$ = upward)
or $L$	latent heat of vaporisation of water
$LE$	latent heat flux (so defined because it equals the product of $L$ and rate of evaporation)
$p$	pressure
$P$	precipitation
PET	potential evapotranspiration
PWV	precipitable water vapour
$Q^*$	net radiative flux at the surface
$R \downarrow$ & $R \uparrow$	net incoming and outgoing planetary radiation
$S_F$	solar (flux) constant (= $1370 \text{ W m}^{-2}$ )
$S$	instantaneous top-of-the-atmosphere solar flux (= $S_F/4$ )

*List of symbols*

$t$	time
$T$	temperature
$T_d$	dew point temperature
$V_g$	geostrophic wind
$z$	height (in the atmosphere)
$Z$	solar zenith angle

*Greek*

$\gamma$	environmental lapse rate
$\Gamma_d$	dry adiabatic lapse rate (DALR)
$\Gamma_s$	saturated adiabatic lapse rate (SALR)
$\Delta$	indicates a small change in the associated variable (e.g. $\Delta T$ = small change in temperature)
$\epsilon$	emissivity
$\phi$	potential temperature
$\lambda$	wavelength (when a subscript indicates occurrence at a specific wavelength)
$\rho$	density
$\sigma$	Stefan–Boltzmann’s constant ( $= 5.67 \times 10^{-8} \text{ W m}^{-2} \text{ K}^{-4}$ )
<i>or</i> $\sigma$	standard deviation
$\tau$	optical thickness (of atmosphere or cloud)
$\theta$	latitude
$\Omega$	angular rotation rate of the Earth

3.9.2	Applications of precipitation information	146
3.10	The water balance	148

## **Chapter 4 The General Circulation and Global Climate 151**

4.1	The function of the general circulation	154
4.2	Atmospheric pressure	159
4.3	Air movement around a rotating planet	164
4.4	Barotropic and baroclinic conditions	170
4.5	The general circulation of the atmosphere	175
4.6	The mid-latitude baroclinic zone	181
4.7	Large-scale effects of the surface boundary	185

4.7.1	Oceans	185
4.7.2	Cryosphere	192
4.7.3	Continents	195
 <b>Chapter 5 Regional Climates</b>		 <b>201</b>
5.1	Climate classification	204
5.1.1	Development of thunderstorm regions for the United States: an example of climatic classification	205
5.1.2	Methods of classification of climate	208
5.2	The empiric approach	209
5.2.1	The Köppen classification	210
5.3	Tropical climates – the Hadley cell	214
5.3.1	Hurricanes	226
5.4	Tropical climates – the monsoon regime	232
5.5	Mid-latitude weather	237
5.6	Mid-latitude climate regions	248
5.7	Polar climates	257
5.8	Changes in regional climates	262
 <b>Chapter 6 Local Climates</b>		 <b>269</b>
6.1	Factors controlling local climates	272
6.2	The importance of surface type	278
6.3	The urban climate	284
6.3.1	Airflow around obstacles and its implications for city planning	292
6.4	The influence of topography	296
6.4.1	Local winds	305
6.5	The influence of larger-scale atmospheric features	310
6.6	Defining and measuring local climates	315
6.7	Inadvertent climate modification	317
6.7.1	Air pollution	318

6.8	Deliberate climate modification	326
6.9	The human response to climate	329

<b>Chapter 7</b>	<b>The Future – Climate Change, Climate Models, Climate Impacts</b>	<b>341</b>
7.1	Mechanisms of climatic change	344
7.1.1	External causes of climatic change	344
7.1.2	Internal causes of climatic change	349
7.2	Global-scale climate models	354
7.2.1	Energy balance climate models	363
7.2.2	One-dimensional radiative–convective climate models	366
7.2.3	Two-dimensional climate models	368
7.2.4	General circulation climate models	369
7.2.5	Climatic feedback effects	373
7.3	Local climate models	377
7.3.1	Agricultural production and climate	378
7.3.2	Water resources	383
7.4	Changes and cycles in the climate system	386
7.4.1	Geological record of climate	387
7.4.2	Shorter time scale climatic changes	391
7.4.3	Historical climatic change	394
7.5	Climatic changes and their impact on Man	397
7.6	Future climates – the probable impact of carbon dioxide	404
7.7	Epilogue	415
	Suggested Further Reading	421
	Glossary	423
	Appendix SI units	431
