# 影印版说明

MOMENTUM PRESS 出版的 *Plastics Technology Handbook* (2 卷) 是介绍塑料知识与技术的大型综合性手册, 内容涵盖了从高分子基本原理, 到塑料的合成、种类、性能、配料、加工、制品, 以及模具、二次加工等各个方面。通过阅读、学习本手册, 无论是专业人员还是非专业人员, 都会很快熟悉和掌握塑料制品的设计和制造方法。可以说一册在手, 别无他求。

原版 2 卷影印时分为 11 册, 第 1 卷分为 :

塑料基础知识·塑料性能

塑料制品生产

注射成型

挤压成型

吹塑成型

热成型

发泡成型·压延成型

第 2 卷分为 :

涂层·浇注成型·反应注射成型·旋转成型

压缩成型·增强塑料·其他工艺

模具

辅机与二次加工设备

唐纳德 V·罗萨多, 波士顿大学化学学士学位, 美国东北大学 MBA 学位, 马萨诸塞大学洛厄尔分校工程塑料和加州大学工商管理博士学位(伯克利)。著有诸多论文及著作, 包括《塑料简明百科全书》、《注塑手册(第三版)》以及塑料产品材料和工艺选择手册等。活跃于塑料界几十年, 现任著名的 Plasti Source Inc. 公司总裁, 并是美国塑料工业协会(SPI)、美国塑料学会(PIA)和 SAMPE(The Society for the Advancement of Material and Process Engineering)的重要成员。

*University of Massachusetts—Lowell Professor of Plastics Engineering & Plastics Department Head (Retired)*

*Plastics Institute of America*

*Secretary & Director for Educational and Research Programs*

Momentum Press, LLC, New York

## PREFACE

This book, as a four-volume set, offers a simplified, practical, and innovative approach to understanding the design and manufacture of products in the world of plastics. Its unique review will expand and enhance your knowledge of plastic technology by defining and focusing on past, current, and future technical trends. Plastics behavior is presented to enhance one's capability when fabricating products to meet performance requirements, reduce costs, and generally be profitable. Important aspects are also presented for example to gain understanding of the advantages of different materials and product shapes. Information provided is concise and comprehensive.

Prepared with the plastics technologist in mind, this book will be useful to many others. The practical and scientific information contained in this book is of value to both the novice including trainees and students, and the most experienced fabricators, designers, and engineering personnel wishing to extend their knowledge and capability in plastics manufacturing including related parameters that influence the behavior and characteristics of plastics. The tool maker (mold, die, etc.), fabricator, designer, plant manager, material supplier, equipment supplier, testing and quality control personnel, cost estimator, accountant, sales and marketing personnel, new venture type, buyer, vendor, educator/trainer, workshop leader, librarian, industry information provider, lawyer, and consultant can all benefit from this book. The intent is to provide a review of the many aspects of plastics that range from the elementary to practical to the advanced and more theoretical approaches. People with different interests can focus on and interrelate across subjects in order to expand their knowledge within the world of plastics.

Over 20000 subjects covering useful pertinent information are reviewed in different chapters contained in the four volumes of this book, as summarized in the expanded table of contents and index. Subjects include reviews on materials, processes, product designs, and so on. From a pragmatic standpoint, any theoretical aspect that is presented has been prepared so that the practical person will understand it and put it to use. The theorist, in turn will gain an insight into

the practical limitations that exist in plastics as they exist in other materials such as steel, wood, and so on. There is no material that is “perfect.” The four volumes of this book together contain 1800 plus figures and 1400 plus tables providing extensive details to supplement the different subjects.

In working with any material (plastics, metal, wood, etc.), it is important to know its behavior in order to maximize product performance relative to cost/efficiency. Examples of different plastic materials and associated products are reviewed with their behavior patterns. Applications span toys, medical devices, cars, boats, underwater devices, containers, springs, pipes, buildings, aircraft, and spacecraft. The reader’s product to be designed and/or fabricated can directly or indirectly be related to products reviewed in this book. Important are behaviors associated with and interrelated with the many different plastics materials (thermoplastics, thermosets, elastomers, reinforced plastics) and the many fabricating processes (extrusion, injection molding, blow molding, forming, foaming, reaction injection molding, and rotational molding). They are presented so that the technical or nontechnical reader can readily understand the interrelationships of materials to processes.

This book has been prepared with the awareness that its usefulness will depend on its simplicity and its ability to provide essential information. An endless amount of data exists worldwide for the many plastic materials that total about 35000 different types. Unfortunately, as with other materials, a single plastic material does not exist that will meet all performance requirements. However, more so than with any other materials, there is a plastic that can be used to meet practically any product requirement(s). Examples are provided of different plastic products relative to critical factors ranging from meeting performance requirements in different environments to reducing costs and targeting for zero defects. These reviews span small to large and simple to complex shaped products. The data included provide examples that span what is commercially available. For instance, static physical properties (tensile, flexural, etc.), dynamic physical properties (creep, fatigue, impact, etc.), chemical properties, and so on, can range from near zero to extremely high values, with some having the highest of any material. These plastics can be applied in different environments ranging from below and on the earth’s surface, to outer space.

Pitfalls to be avoided are reviewed in this book. When qualified people recognize the potential problems that can exist, these problems can be designed around or eliminated so that they do not affect the product’s performance. In this way, costly pitfalls that result in poor product performance or failure can be reduced or eliminated. Potential problems or failures are reviewed with solutions also presented. This failure/solution review will enhance the intuitive skills of people new to plastics as well as those who are already working in plastics. Plastic materials have been produced worldwide over many years for use in the design and fabrication of all kinds of plastic products that profitably and successfully meet high quality, consistency, and long-life standards. All that is needed is to understand the behavior of plastics and properly apply these behaviors.

Patents or trademarks may cover certain of the materials, products, or processes presented. They are discussed for information purposes only and no authorization to use these patents or trademarks is given or implied. Likewise, the use of general descriptive names, proprietary names, trade names, commercial designations, and so on does not in any way imply that they may be used freely. While the information presented represents useful information that can be studied or

---

analyzed and is believed to be true and accurate, neither the authors, contributors, reviewers, nor the publisher can accept any legal responsibility for any errors, omissions, inaccuracies, or other factors. Information is provided without warranty of any kind. No representation as to accuracy, usability, or results should be inferred.

Preparation for this book drew on information from participating industry personnel, global industry and trade associations, and the authors' worldwide personal, industrial, and teaching experiences.

DON & MARLENE ROSATO AND NICK SCHOTT, 2010

## ABOUT THE EDITORS

**Dr. Donald V. Rosato**, president of PlastiSource, Inc., a prototype manufacturing, technology development, and marketing advisory firm in Massachusetts, United States, is internationally recognized as a leader in plastics technology, business, and marketing. He has extensive technical, marketing, and plastics industry business experience ranging from laboratory testing to production to marketing, having worked for Northrop Grumman, Owens-Illinois, DuPont/Conoco, Hoechst Celanese/Ticona, and Borg Warner/G.E. Plastics. He has developed numerous polymer-related patents and is a participating member of many trade and industry groups. Relying on his unrivaled knowledge of the industry plus high-level international contacts, Dr. Rosato is also uniquely positioned to provide an expert, inside view of a range of advanced plastics materials, processes, and applications through a series of seminars and webinars. Among his many accolades, Dr. Rosato has been named Engineer of the Year by the Society of Plastics Engineers. Dr. Rosato has written extensively, authoring or editing numerous papers, including articles published in the *Encyclopedia of Polymer Science and Engineering*, and major books, including the *Concise Encyclopedia of Plastics*, *Injection Molding Handbook 3rd ed.*, *Plastic Product Material and Process Selection Handbook*, *Designing with Plastics and Advanced Composites*, and *Plastics Institute of America Plastics Engineering, Manufacturing and Data Handbook*. Dr. Rosato holds a BS in chemistry from Boston College, MBA at Northeastern University, MS in plastics engineering from University of Massachusetts Lowell, and PhD in business administration at University of California, Berkeley.

**Marlene G. Rosato**, with stints in France, China, and South Korea, has very comprehensive international plastics and elastomer business experience in technical support, plant start-up and troubleshooting, manufacturing and engineering management, business development and strategic planning with Bayer/Polysar and DuPont and does extensive international technical, manufacturing, and management consulting as president of Gander International Inc. She also has an extensive

writing background authoring or editing numerous papers and major books, including the *Concise Encyclopedia of Plastics*, *Injection Molding Handbook 3rd ed.*, and the *Plastics Institute of America Plastics Engineering, Manufacturing and Data Handbook*. A senior member of the Canadian Society of Chemical Engineering and the Association of Professional Engineers of Canada, Ms. Rosato is a licensed professional engineer of Ontario, Canada. She received a Bachelor of Applied Science in chemical engineering from the University of British Columbia with continuing education at McGill University in Quebec, Queens University and the University of Western Ontario both in Ontario, Canada, and also has extensive executive management training.

**Professor Nick Schott**, a long-time member of the world-renowned University of Massachusetts Lowell Plastics Engineering Department faculty, served as its department head for a quarter of a century. Additionally, he founded the Institute for Plastics Innovation, a research consortium affiliated with the university that conducts research related to plastics manufacturing, with a current emphasis on bioplastics, and served as its director from 1989 to 1994. Dr. Schott has received numerous plastics industry accolades from the SPE, SPI, PPA, PIA, as well as other global industry associations and is renowned for the depth of his plastics technology experience, particularly in processing-related areas. Moreover, he is a quite prolific and requested industry presenter, author, patent holder, and product/process developer, in addition to his quite extensive and continuing academic responsibilities at the undergraduate to postdoctoral level. Among America's internationally recognized plastics professors, Dr. Nick R. Schott most certainly heads everyone's list not only within the 2500 plus global UMASS Lowell Plastics Engineering alumni family, which he has helped grow, but also in broad global plastics and industrial circles. Professor Schott holds a BS in ChE from UC Berkeley, and an MS and PhD from the University of Arizona.
