

The background of the book cover is an abstract, textured composition. The upper half features a mix of pink, magenta, and blue hues with visible brushstrokes and a grainy texture. A horizontal band of dark red and orange separates this from the lower half, which is dominated by vibrant orange and yellow tones with similar textured brushwork.

Physical Chemistry: A Very Short Introduction

VERY SHORT INTRODUCTIONS are for anyone wanting a stimulating and accessible way into a new subject. They are written by experts, and have been translated into more than 40 different languages.

The Series began in 1995, and now covers a wide variety of topics in every discipline. The VSI library now contains over 350 volumes—a Very Short Introduction to everything from Psychology and Philosophy of Science to American History and Relativity—and continues to grow in every subject area.

Preface

Physical chemistry provides the conceptual infrastructure of chemistry. It stands up to its knees in physics but has its head in inorganic and organic chemistry, the other two principal branches of chemistry. It follows that to understand modern chemistry, what it achieves, how it achieves it, and how it views the world, it is essential to understand the contributions of physical chemistry.

Physical chemistry, however, is built on a framework of mathematics. Therein lies the difficulty that aspiring students often find with the subject and which this author finds when seeking to share his vision of the subject without frightening his audience. With that in mind, I have sought to present an almost entirely verbal account of the subject so that readers can gather its attitudes and contributions to our understanding without being distracted by equations. Just occasionally, I show an equation to round out the discussion and show the basis of my verbalization; but I do that discreetly.

Standing in physics up to its knees necessarily means that physical chemistry draws on the wonderful contributions that physicists have made to our understanding of the world, and it will become apparent on reading these pages that Nobel Prizes for topics now fully part of physical chemistry have in large part been awarded to

physicists. That is just a mark of the debt that physical chemistry owes to physics. I shall introduce these topics, which include aspects of quantum mechanics and thermodynamics, but only at the level I judge sufficient.

I hope these pages will reveal the contributions that physical chemistry has made to all branches of chemistry. It provides, or at least elucidates, elaborates, and justifies, much of the language of modern chemistry, and these pages will give some insight into that language and the concepts that all chemists use in their conversations and work. I hope too that they will illustrate the cultural contributions that the subject makes to our understanding of the natural world.

Finally, I must stress that although the principles of chemistry are, as far as we know, thoroughly understood, physical chemistry is still a vibrantly alive subject. Such is the sophistication of current and emerging instrumental techniques, including computation, that the sinews of physical chemistry are stretched to wring all the information from the data that the techniques provide. Moreover, new types of matter—I have in mind soft matter and nanosystems—and elaborate ‘old’ matter, biological matter, are now open to study by its techniques and are providing rich fields for its application. I have tried to identify these emerging fields in the concluding ‘The current challenge’ paragraphs of each chapter. Perhaps those paragraphs outline what might be regarded as the research interests of a hypothetical perfect research laboratory in modern physical chemistry, where collaboration with intellectually neighbouring disciplines should be the core strategy.

- 2 The variation in atomic radius across the Periodic Table **10**
- 3 The structure of sodium chloride (NaCl) **12**
- 4 The bonding and antibonding orbitals in a two-atom molecule **20**
- 5 Work is a mode of transfer that is equivalent to raising a weight; heat is a mode of transfer that results from a temperature difference **25**
- 6 Entropy is a measure of 'disorder' **29**
- 7 A reaction is spontaneous in the direction of decreasing Gibbs energy **32**
- 8 The Boltzmann distribution for a series of temperatures **42**
- 9 The role of mixing in the determination of the equilibrium composition of a reaction mixture **47**
- 10 (a) At a given temperature there is a Boltzmann distribution over the states of the reactants and products; (b) when the temperature is raised in this exothermic reaction, more of the higher-energy reactant states are occupied, corresponding to a shift in equilibrium in favour of the reactants **48**
- 11 The perfect gas equation of state summarizes the allowed states of a perfect gas, a gas in which the molecules neither attract nor repel each other **53**
- 12 When the gas molecules do interact with one another, the pressure depends on the

- volume in a more complicated way than is shown in Figure 11 **55**
- 13 The 'Maxwell-Boltzmann distribution of speeds' shows the fraction of molecules having a given speed at a specified temperature and can be used to calculate the mean speed of the molecules **56**
- 14 A depiction of the structure of a liquid composed of spherical molecules **59**
- 15 There are two ways of packing identical uncharged spheres together, one gives a 'cubic' arrangement and the other gives a 'hexagonal' arrangement **63**
- 16 In one form of a liquid crystal (the 'nematic' phase) molecules lie in orderly ranks in each plane but neighbouring planes adopt different orientations **67**
- 17 Three stages in the events resulting in boiling **73**
- 18 A phase diagram, in this case of water, showing the regions of pressure and temperature where each phase is the most stable **75**
- 19 A simple explanation of Henry's law is that at equilibrium the rate at which gas molecules strike the surface of a liquid and penetrate into its bulk matches the rate at which those already present leave **80**
- 20 The effect of a solute on the boiling point of a solvent **82**
- 21 The activation energy is the minimum energy required for reaction and can be interpreted as the height of a barrier between the reactants and products: only molecules with at least the activation energy can pass over it **94**
- 22 A catalyst provides an alternative reaction pathway with a low activation energy **96**
- 23 In an electrochemical cell, the sites of oxidation (electron loss) and reduction (electron gain) are separated, and as the spontaneous reaction proceeds electrons travel from one electrode to the other **101**
- 24 The basic process in NMR is to tune the separation of the two energy levels of a proton in a

- magnetic field to the frequency of a radiofrequency field **110**
- 25 The process occurring at the tip of a scanning tunnelling microscope: the flow of current across the gap is highly sensitive to the width of the gap, and even atom-scale variation can be detected **114**
- 26 A typical STM scan, showing individual atoms on a surface **115**
