In the Memory of our Mothers

Preface

A sound knowledge of the fundamental principles of soil mechanics is essential to predict the behaviour and performance of soil as a construction material or as a foundation. Every site has different problems and sometimes the geotechnical engineer meets with surprises.

The material presented in this book has been designed to suit graduate course. Each chapter has been separately introduced with due emphasis on the practical aspects of the subject matter. A comprehensive range of illustrative examples are given at the end of each chapter followed by practice exercises.

The material has been drawn freely from various books, technical publications, etc., which provided source material for this book and we express our sincere thanks to them. In spite of sincere efforts, some contributions might not have been acknowledged, such omissions are not intentional and we regret for the same.

We will greatly appreciate for being informed about errors and constructive criticism for improving the book.

R.K. Khitoliya

Contents

<i>Preface</i>	vii
1. Introduction	1
1.1 Importance of Soil Engineering	1
1.2 Fundamentals	1
1.3 Historical Review	2
1.4 Soil as Foundation Material	7
1.5 Special Soil Engineering Problems	10
1.6 Solution of Engineering Problems	10
1.7 Formation of Rocks	11
1.8 Formative Classification	12
1.9 Major Factors Affecting the Engineering Properties of Soils	14
1.10 Limitations of Soil Engineering	16
1.11 Terminology of Different Types of Soils	17
2. Basic Terminology and Interrelations	19
2.1 Phases in Soils	19
2.2 Definitions	20
2.3 Unit Wt., Void Ratio, MC and Sp. Gravity Relationship	22
2.4 Saturated Unit Weight (Γ_{sat})	23
<i>Illustrative Examples</i>	24
3. Index Properties of Soil	31
3.1 Index Properties	31
3.2 Particle Size Distribution	31
3.3 Limitations in the use of Stokes' Law in Sedimentation Analysis	34
3.4 Use of Grain Size Distribution Curve	35
3.5 Consistency of Soils	35
3.6 Atterberg's Limits	37
3.7 Atterberg Indices	37
3.8 Determination of Liquid Limit and Plastic Limit Theory and Application	39

3.9 Specific Gravity Determination	42
3.10 Moisture Content Determination	44
3.11 Determination of Field Density	44
3.12 Density Index	46
<i>Illustrative Examples</i>	47
4. Soil Classification Systems	57
4.1 Purpose of Soil Classification	57
4.2 Requirements of a Soil Classification System	57
4.3 Textural Classification	58
4.4 AASHTO Classification System	58
4.5 Unified Soil Classification System (USCS)	60
4.6 Indian Standard Soil Classification System (ISSCS)	61
4.7 Boundary Classifications	63
4.8 Field Identification of Soils	65
<i>Illustrative Examples</i>	69
5. Formation of Soils	73
5.1 Physical Disintegration	73
5.2 Chemical Decomposition	73
5.3 Soil Particles and Clay Mineralogy	74
5.4 Clay Minerals (Soil Fabric and Structure)	76
5.5 Types of Soil Fabric	77
5.6 Atomic and Molecular Bonds	78
5.7 Basic Structural Units	79
5.8 Base Exchange Capacity	82
5.9 Diffuse Double Layer	82
5.10 Adsorbed Water	83
5.11 Activity	84
5.12 Sensitivity and Thixotropy	85
5.13 Engineering Behaviour of Soils	85
6. Soil Water and Effective Stress	93
6.1 Capillary Tubes and Rise of Water	93
6.2 Volume Change of Clay (Swelling & Shrinkage)	95
6.3 Effective and Neutral Stresses	97
6.4 Stresses in Saturated Soil Mass	99
6.5 Frost Action	103

6.6 Frost Heave	103
6.7 Frost Boil	103
6.8 Capillary Syphoning	104
6.9 Slaking of Clay	104
6.10 Bulking of Sand	105
<i>Illustrative Examples</i>	105
7. Permeability of Soils	110
7.1 Permeability	110
7.2 Darcy's Law (1856)	111
7.3 Discharge Velocity and Seepage Velocity	112
7.4 Validity of Darcy's Law	112
7.5 Determination of Coefficient of Permeability	114
7.6 Capillarity-Permeability Test	121
7.7 Permeability of Stratified Soil Deposits	123
<i>Illustrative Examples</i>	125
8. Seepage Analysis	130
8.1 Laplace's Equation	131
8.2 Determining Seepage Discharge	133
8.3 Construction of Flow Net (Graphical Method)	134
8.4 To Draw Phreatic Line in an Earth Dam (Casagrande Method)	135
8.5 Quick Sand Condition	136
8.6 Seepage Force	137
8.7 Piping	137

Introduction

1.1 IMPORTANCE OF SOIL ENGINEERING

Once it is accepted that soil is a structural material, its importance in Civil Engineering becomes paramount. A Geotechnical Engineer should have thorough knowledge of this material of structure as in the case of any other structural material.

Study of Soil Engineering is particularly important in respect of infrastructure development and constructions, viz., highway and airport pavements, foundations and underground structures, retaining walls and embankments and multistorey buildings.

Foundation is considered the most critical part of any structure and it is on its soundness that the stability of the entire structure depends. Since the load bearing capacity of the foundation has a direct relationship with the soil characteristics, the importance of soil investigation should not be underestimated.

1.2 FUNDAMENTALS

The word 'soil' derives from the Latin word **solium**, which means, the upper layer of the earth that may be dug or powdered, specifically, the loose surface material of the earth in which plants grow.

The term 'soil' in soil engineering is defined as an unconsolidated material composed of solid particles, produced by the disintegration of rocks. The void space between the particles may contain air, water or both. The solid particles may contain organic matter. The soil particles can be separated by such mechanical means as agitation in water.

A natural aggregate of mineral particles bonded by strong and permanent cohesive forces is called a 'rock'.

Application of laws and principles of mechanics and hydraulics to engineering problems in dealing with soil is usually referred to as Soil Mechanics. The term soil engineering is used to cover a much wider scope implying that it is a practical science rather than a purely fundamental or mathematical one. Hence, Soil Engineering is an applied science dealing with the application of the principles of soil mechanics to practical problems.

2 Geotechnical Engineering

It includes site investigation, design and construction of the foundation, earth retaining structures and earth structures.

1.3 HISTORICAL REVIEW

The use of soil as an engineering material may be said to be as old as mankind itself. Since that time, man has been confronting many types of problems while dealing with soils.

Excellent pavements: **Egypt and India** much before the Christian Era.

Some earth dams have been used for storage of water in India for more than 2000 years.

During the excavation at the early civilization sites of at Mohenjodaro and Harrappa in the Indian subcontinent indicate the use of soil as foundation and construction material.

Egyptians used caissons for deep foundations even in 2000 BC.

The hanging gardens at Babylon (Iraq) were also built during the period.

The leaning tower of Pisa was also built around same time. The tower has leaned on one side because of the differential settlement of its base.

In the 17th century, Leonardo da Vinci constructed a number of structures in France, and the London Bridge in England.

The Taj Mahal at Agra is built on masonry cylindrical wells sunk into the soil at close intervals.

The builders were guided by the knowledge and experience passed down from generation to generation.

In 1773, a French engineer Coulomb gave the theory of earth pressure on retaining walls. Coulomb also introduced the concept that the shearing resistance of soil consists of two components: cohesion and friction.

Darcy in 1856 gave the law of permeability. This law is used for the computation of seepage through soils.

In the same year, Stokes gave the law for the velocity of fall of solid particles through fluids. This law is used for determining the particle size.

O-Mohr in 1871 gave the rupture theory for soils. He gave a graphical method of representation of stresses. Popularly known as Mohr's circle, it is extremely useful for determining stresses on inclined planes.

Boussinesq in 1885 gave the theory of stress distribution in a semi-infinite homogeneous, isotropic, elastic medium due to an externally applied load. The theory is used for determining stresses in soils due to loads.

Atterberg in 1911, suggested some simple tests for characterizing the consistency of cohesive soils. These limits are useful for identification and classification of soils.

Prof. Fellenius (Sweden) in 1913 studied the stability of slopes. Swedish circle method for checking the stability of Sweden slopes are popularly used.

The modern era of soil engineering began in 1925, with the publication of the book, **Eradbaumechanic**, by Karl Terzaghi. He is fittingly called the father of soil mechanics.

His theory of consolidation of soils and the effective stress principle gave a new direction. Proctor in 1933, did a pioneering work on the compaction of soils.

Taylor worked on the consolidation of soils, shear strength of clays and the stability of slopes.

Casagrande worked on the classification of soils, seepage through earth masses and consolidation.

Skempton did a pioneering work on pore pressure, effective stress, bearing capacity and the stability of slopes.

Mayerhof gave the theories of B.C. of shallow and deep foundations.

Hvorlov did a commendable work on sub-surface exploration and on the shear strength of remoulded clays.

Some of the events relevant to the subject that took place in past are given below:

Table 1.1 Indian Geotechnical Conferences – Venue

1.	1960	New Delhi	First Asian Regional Conference
2.	1961	Bangalore	Symposium on Foundation Engineering
3.	1962-1963		During this period, Technical Sessions along with the Annual General Session were held
4.	1964	Hyderabad	Technical Session along with the 7 th Annual General Session
5.	1965	Poona	Symposium on the Foundation of Power Houses and Heavy Machines
6.	1966-1967		During this period, Technical Sessions along with the Annual General Session were held
7.	1968	Talwara	Symposium on Rockfill Dams–Beas Dam
8.	1969	Ahmedabad	Technical Session along with the Annual General Session
9.	1970	Bombay	Symposium on Shallow Foundations
10.	1971	Ahmedabad	Technical Session along with the Annual General Session
11.	1972	New Delhi	Technical Session along with the Annual General Session
12.	1973	Kurukshetra	Symposium on Rock Mechanics & Tunnelling Problems was held during the Silver Jubilee Celebrations
13.	1974	Warangal	Technical Session along with the Annual General Session
14.	1975	Bangalore	Fifth Asian Regional Conference
15.	1976	Calcutta	Symposium on Foundations and Excavations in Weak Soils
16.	1977	Kanpur	Symposium on Expansive Soils
