# PREFACE

## to the Second Edition

With today's familiar cry by students for "relevance" in course work, analytical chemistry stands out as one example of a practical and useful subject. Chemical analysis is used in many fields of science, from the clinical laboratory, the biochemist's laboratory, and the physiologist's laboratory to the engineer's laboratory. It is used as an intrinsic tool in geology, oceanography, and air and water pollution. Rare is the chemist who does not rely frequently upon analytical chemistry for the solution of his problems.

The wide utility of analytical chemistry is sufficient reason alone for treating it as an individual course. Another reason, nearly as important, is that the analytical chemistry course is one of the few where the student learns careful and quantitative laboratory skills and techniques. These skills are critically important for the nurse, the physician, the dentist, the pharmacist, and for those in many other professions. Analytical chemistry becomes a little more exciting when the student realizes that an incorrect blood analysis may endanger a patient's life, or that an error in quality-control analysis may result in serious financial loss for a manufacturer.

The emphasis of this second edition of *Analytical Chemistry* remains the same as in the first. It is for the nonchemistry major, with emphasis on the life sciences applications of analytical chemistry. A practical approach is retained with a deemphasis of complex equilibria as much as is practical. Some sections on equilibria have been expanded somewhat, however, in order to make the discussions less intuitive in nature. The section on complexation equilibria, for example, is expanded so that tabulated formation constants (added in Appendix C) can be used in calculations. The discussion of solubility product equilibria has been moved from Chapter 13, "Precipitation and Complexometric Titrations," to Chapter 6, "Gravimetric Analysis," since the equilibria are useful in understanding the precipitation phenomena.

The organization of the text remains essentially the same, following the orderly sequence of an analysis. The major change is placing Chapter 4, "Data Handling," toward the front of the text, since these skills are required early in the laboratory experiments. Major sections have been kept sufficiently separated from each other that they can be covered in different sequence. Some instructors, for example, may prefer to delay the teaching of separation methods until the student has a more thorough grounding in the basic equilibria that are covered in the chapters on volumetric measurement.

New chapters on nonaqueous titrations and drug analysis have been added. Acid-base theories have been moved to Chapter 12, "Nonaqueous Titrations," so that the student will be well grounded in the more familiar Arrhenius theory first.

A number of sections have been expanded and new ones added. Tests of significance are included in Chapter 4, since they are widely used in the life sciences. A description of multiple extractions (countercurrent distribution) has been added to Chapter 7, "Solvent Extraction," a logical lead-up to chromatographic separations in Chapter 8. An important addition to that chapter is a major section on the new technique of high-speed liquid chromatography.

The concept of normality is introduced in Chapter 9, "Principles of Volumetric Analysis." Dimensional units are included in calculations throughout the text to give the student a better feel for the proper setting up of problems. Also,

new homework problems have been added. The more challenging problems are marked with an asterisk. As before, a solutions manual is available containing detailed calculations for problems and answers for questions; this should serve as a reinforcing aid for the student.

The review of balancing redox reactions has been moved to Chapter 14, "Reduction-Oxidation Titrations," which uses a simpler method for balancing that does not require knowledge of the changes in oxidation states. The discussion of potentiometric titrations now includes derivative titrations and Gran's plot titrations (the latter a particularly useful technique for use with ion selective electrodes).

In Chapter 17, "Spectrometry," an expanded section has been added on the relationship of absorption spectra to molecular structure, and the quantitative analysis of mixtures of substances with overlapping spectra is also covered. A discussion of nonflame atomization techniques has been added to the section on atomic absorption spectrophotometry.

The discussion of the principles of enzyme rate methods is expanded in Chapter 19, "Kinetic Methods of Analysis," for a more thorough understanding of the capabilities of the techniques. A section on enzymes in diagnosis of disease is also included in Chapter 23, "Clinical Chemistry," along with the new technique of radioimmunoassay. Chapter 20, "Radiochemical Methods of Analysis," includes a description of solid-state semiconductor detectors, and the centrifugal analyzer is described in Chapter 22, "Automation in the Laboratory." Chapter 25, "Pollution Analysis," now includes descriptions of sampling procedures and summaries of representative analyses.

In order to make room for the new material, some topics had to be eliminated. The chapter on laboratory safety was deleted, and hopefully the instructor will have the necessary information available in the laboratory anyway. The less-used chapters on miscellaneous methods of separation and optical rotatory dispersion were taken out. The chapter on sampling was eliminated (with essential parts retained in other chapters), since this is frequently not covered and adequate treatment is better left to more advanced texts. The same is true of the chapter on the development of an analytical procedure, although the description of the literature of analytical chemistry is included in Appendix A. The section on classical methods of gas analysis was deleted since gas chromatography is now widely used in place of these methods. Also, it was felt that proper treatment of the use of computers in analytical chemistry is better handled in a more advanced text or a separate course.

Eight of the old experiments have been eliminated while 14 new ones have been added, for a total of 51 experiments. A gravimetric nickel-dimethylglyoxime experiment was added as an alternative to the more expensive silver chloride experiment. Similarly, a precipitation titration of sulfate in urine is included as an alternative to the more expensive mercurimetric titration of blood or urine chloride. A number of environmentally related experiments have been added. These include the determination of sulfur dioxide in air, mercury in air, nitrate in water, detergents in water, and lead on leaves. Many of these can be used in place of other spectrophotometric experiments. Additional new experiments include thin-layer chromatography of amino acids, two nonaqueous titrations, potentiometric determination of fluoride in water, spectrophotometric determination of a mixture of chromium and man-

ganese, fluorometric determination of riboflavin, atomic absorption determination of copper in urine, and ultraviolet analysis of APC tablets.

Ion-exchange chromatography experiments and solvent extraction experiments have been integrated with experiments in later chapters, since titrations or spectrophotometric measurements are required to complete the analyses.

All experiments have been reorganized. More detailed descriptions of the principles are given, along with chemical reactions involved. The directions are organized with more subheadings to identify each step, and instructions are given in each experiment in order to be prepared to complete the experiment during one laboratory session. Most of the experiment footnotes in the first edition have been included in the text of the experiments, since many were an integral part. The experiments in the earlier chapters dealing with fundamentals of different analytical techniques include directions for calculations. But the later experiments in the applications chapters have these omitted, since the student should be better equipped to handle calculations at this stage.

Several experiments again require the use of either blood or urine. Various sources of blood are available, including freeze-dried standard serum samples or outdated blood-bank blood. Animal blood is usually satisfactory. Various types of animal blood preparations can be obtained from Animal Blood Centre, Inc., P.O. Box 2, Dewitt Branch, Syracuse, New York.

The suggestions of a number of colleagues have aided greatly in the revision of the text. The author would like to express his appreciation to Professors T. R. Dickson, Robert L. Grob, Janan Hayes, Calvin O. Huber, Harold M. McNair, Robert L. Osburn, Gordon A. Parker, and Robert L. Peckso. Dr. Larry H. Thomas and Linda Marshall checked all the calculations for the solutions manual, an arduous but much appreciated task. I especially thank my students and other users of the text who have contributed comments and suggestions for changes.

**Solutions Manual.** A comprehensive solutions manual is available for use by students in which all problems are completely worked out. Also, all questions are answered, summarizing the appropriate material in the text with the corresponding text page numbers given.

# CONTENTS

## LIST OF EXPERIMENTS

1. The effect of temperature on the rate of reaction of hydrogen peroxide with potassium iodide	1
2. The effect of concentration on the rate of reaction of hydrogen peroxide with potassium iodide	1
3. The effect of surface area on the rate of reaction of hydrogen peroxide with potassium iodide	1
4. The effect of a catalyst on the rate of reaction of hydrogen peroxide with potassium iodide	1
5. The effect of pH on the rate of reaction of hydrogen peroxide with potassium iodide	1
6. The effect of ionic strength on the rate of reaction of hydrogen peroxide with potassium iodide	1
7. The effect of solvent on the rate of reaction of hydrogen peroxide with potassium iodide	1
8. The effect of light on the rate of reaction of hydrogen peroxide with potassium iodide	1
9. The effect of pressure on the rate of reaction of hydrogen peroxide with potassium iodide	1
10. The effect of magnetic field on the rate of reaction of hydrogen peroxide with potassium iodide	1
11. The effect of ultrasound on the rate of reaction of hydrogen peroxide with potassium iodide	1
12. The effect of microwave radiation on the rate of reaction of hydrogen peroxide with potassium iodide	1
13. The effect of gamma radiation on the rate of reaction of hydrogen peroxide with potassium iodide	1
14. The effect of X-ray radiation on the rate of reaction of hydrogen peroxide with potassium iodide	1
15. The effect of electron beam radiation on the rate of reaction of hydrogen peroxide with potassium iodide	1
16. The effect of ultraviolet radiation on the rate of reaction of hydrogen peroxide with potassium iodide	1
17. The effect of infrared radiation on the rate of reaction of hydrogen peroxide with potassium iodide	1
18. The effect of radio waves on the rate of reaction of hydrogen peroxide with potassium iodide	1
19. The effect of microwaves on the rate of reaction of hydrogen peroxide with potassium iodide	1
20. The effect of terahertz waves on the rate of reaction of hydrogen peroxide with potassium iodide	1
21. The effect of visible light on the rate of reaction of hydrogen peroxide with potassium iodide	1
22. The effect of ultraviolet light on the rate of reaction of hydrogen peroxide with potassium iodide	1
23. The effect of infrared light on the rate of reaction of hydrogen peroxide with potassium iodide	1
24. The effect of radio waves on the rate of reaction of hydrogen peroxide with potassium iodide	1
25. The effect of microwaves on the rate of reaction of hydrogen peroxide with potassium iodide	1
26. The effect of terahertz waves on the rate of reaction of hydrogen peroxide with potassium iodide	1
27. The effect of gamma rays on the rate of reaction of hydrogen peroxide with potassium iodide	1
28. The effect of X-rays on the rate of reaction of hydrogen peroxide with potassium iodide	1
29. The effect of electron beams on the rate of reaction of hydrogen peroxide with potassium iodide	1
30. The effect of ultraviolet rays on the rate of reaction of hydrogen peroxide with potassium iodide	1
31. The effect of infrared rays on the rate of reaction of hydrogen peroxide with potassium iodide	1
32. The effect of radio waves on the rate of reaction of hydrogen peroxide with potassium iodide	1
33. The effect of microwaves on the rate of reaction of hydrogen peroxide with potassium iodide	1
34. The effect of terahertz waves on the rate of reaction of hydrogen peroxide with potassium iodide	1
35. The effect of gamma rays on the rate of reaction of hydrogen peroxide with potassium iodide	1
36. The effect of X-rays on the rate of reaction of hydrogen peroxide with potassium iodide	1
37. The effect of electron beams on the rate of reaction of hydrogen peroxide with potassium iodide	1
38. The effect of ultraviolet rays on the rate of reaction of hydrogen peroxide with potassium iodide	1
39. The effect of infrared rays on the rate of reaction of hydrogen peroxide with potassium iodide	1
40. The effect of radio waves on the rate of reaction of hydrogen peroxide with potassium iodide	1
41. The effect of microwaves on the rate of reaction of hydrogen peroxide with potassium iodide	1
42. The effect of terahertz waves on the rate of reaction of hydrogen peroxide with potassium iodide	1
43. The effect of gamma rays on the rate of reaction of hydrogen peroxide with potassium iodide	1
44. The effect of X-rays on the rate of reaction of hydrogen peroxide with potassium iodide	1
45. The effect of electron beams on the rate of reaction of hydrogen peroxide with potassium iodide	1
46. The effect of ultraviolet rays on the rate of reaction of hydrogen peroxide with potassium iodide	1
47. The effect of infrared rays on the rate of reaction of hydrogen peroxide with potassium iodide	1
48. The effect of radio waves on the rate of reaction of hydrogen peroxide with potassium iodide	1
49. The effect of microwaves on the rate of reaction of hydrogen peroxide with potassium iodide	1
50. The effect of terahertz waves on the rate of reaction of hydrogen peroxide with potassium iodide	1

| 8.1 Paper Chromatography Separation and Identification of Metal Ions 179  | 15.2 Potentiometric Titration of a Mixture of Chloride and Iodide 373  |
| 8.2 Thin-Layer Chromatography Separation of Amino Acids 180   | 15.3 Potentiometric Titration of Lead with Sodium Oxalate, Using a Lead Ion-Selective Electrode 374          |
| 8.3 Gas Chromatographic Analysis of a Tertiary Mixture 181  | 15.4 Determination of Ionized Calcium in Serum with a Calcium Ion-Selective Electrode 375                    |
| 11.1 Determination of Replaceable Hydrogen in an Acid by Titration with Sodium Hydroxide 241                        | 15.5 Potentiometric Determination of Fluoride in Drinking Water Using a Fluoride Ion-Selective Electrode 377 |
| 11.2 Determination of Total Alkalinity of Soda Ash 243  | 16.1 Electrolytic Determination of Copper in Ore 406   |
| 11.3 Determination of Bicarbonate in Blood 246  | 16.2 Polarographic Determination of a Trace Metal 408  |
| 12.1 Titration of a Weak Base in Glacial Acetic Acid 263  | 16.3 Amperometric Titration of Lead with Dichromate 409  |
| 12.2 Titration of a Weak Acid Mixture in Methylisobutyl Ketone 265  | 16.4 Coulometric Titration of Arsenic with Iodine 410  |
| 13.1 Determination of Silver in an Alloy: Volhard's Method 281  | 17.1 Spectrophotometric Determination of Iron 456  |
| 13.2 Determination of Chloride in a Soluble Chloride: Fajan's Method 283  | 17.2 Spectrophotometric Determination of Inorganic Phosphorus in Human Serum or Urine 457                    |
| 13.3 Mercurimetric Determination of Blood or Urine Chloride 284   | 17.3 Spectrophotometric Determination of Manganese and Chromium in Mixture 458                               |
| 13.4 Determination of Water Hardness with EDTA 287  |  |
| 13.5 Anion Ion Exchange Chromatography Separation of Cobalt and Nickel Followed by EDTA Titration of the Metals 289 |  |
| 13.6 Determination of Sulfate in Urine by Precipitation   |  |

- 17.4 Fluorometric Determination of Riboflavin (Vitamin B<sub>2</sub>) 460
- 17.5 Fluorometric Determination of Aluminum with Oxine 461
- 17.6 Infrared Determination of a Mixture of Benzene and Carbon Tetrachloride 462
- 18.1 Flame Photometric Determination of Sodium 480
- 18.2 Determination of Calcium by Atomic Absorption Spectrophotometry 481
- 18.3 Solvent Extraction-Atomic Absorption Spectrophotometric Determination in Copper in Urine 483
- 19.1 Catalytic Determination of Traces of Selenium 505
- 19.2 Enzymatic Determination of Glucose in Blood 506
- 19.3 Determination of Lactic Dehydrogenase (LDH) in Serum 507
- 20.1 Radioactive Tracer Studies 533
- 21.2 Gas Volumetric Determination of Oxygen and Carbon Dioxide in Air or Breath 546
- 24.1 Ultraviolet Spectrophotometric Determination of Aspirin, Phenacetin, and Caffeine in APC Tablets 594
- 25.1 Colorimetric Determination of Sulfur Dioxide in Air 614
- 25.2 Determination of Mercury in Laboratory Air or Water Using Flameless Atomic Absorption Spectrophotometry 616
- 25.3 Determination of Nitrate Nitrogen in Water 618
- 25.4 Determination of Detergents in Water 619
- 25.5 Determination of Lead on Leaves 620

## **PART ONE Principles of Analytical Chemistry**

### **1. Introduction 3**

- 1.1 The Analytical Process 4
- 1.2 Range 7
- 1.3 Review of Fundamental Concepts 8

### **2. Expression of Analytical Results 13**

- 2.1 Solid Samples 14
- 2.2 Liquid Samples 15

### **3. Basic Tools of Analytical Chemistry 19**

- 3.1 The Laboratory Notebook 20
- 3.2 Laboratory Materials and Reagents 21
- 3.3 The Analytical Balance 23

- 3.4 Volumetric Glassware 31
- 3.5 Other Apparatus 41
- 3.6 Microapparatus 50
- 3.7 Operations of Drying and Dissolving the Sample 50

## **PART TWO Data Handling 57**

### **4. Data Handling**

- 4.1 Significant Figures 59
- 4.2 Rounding Off 62
- 4.3 Accuracy and Precision 63
- 4.4 Determinate Errors 63
- 4.5 Indeterminate Errors 64
- 4.6 Ways of Expressing Accuracy 65
- 4.7 Ways of Expressing Precision 66
- 4.8 Rejection of a Result 69
- 4.9 Tests of Significance 71
- 4.10 The Correlation Coefficient

## **PART THREE Preparing the Sample 79**

### **5. Preparing a Solution of the Analyte 80**

- 5.1 Drying the Sample 81
- 5.2 Sample Dissolution 81

## **PART FOUR Methods of Separation 87**

### **6. Gravimetric Analysis 88**

- 6.1 Precipitation Equilibria 89
- 6.2 Unit Operations 92
- 6.3 Calculations 100
- 6.4 Examples of Gravimetric Analysis 105
- 6.5 Organic Precipitates 106

### **7. Solvent Extraction 115**

- 7.1 Principles 116
- 7.2 Solvent Extraction of Metals 119
- 7.3 Analytical Separations 123
- 7.4 Multiple Extractions 125
- 7.5 Solvent Extraction Experiments 130

### **8. Chromatographic Methods 132**

- 8.1 Principles 133
- 8.2 Classification of Chromatographic Techniques 136
- 8.3 Techniques of Column Chromatography 137
- 8.4 Molecular Exclusion Chromatography 140
- 8.5 Ion Exchange Chromatography 143
- 8.6 Gas Chromatography 151
- 8.7 High-Speed Liquid Chromatography 164
- 8.8 Paper Chromatography 173
- 8.9 Thin-Layer Chromatography 174
- 8.10 Electrophoresis 175

- 8.11 Ion Exchange Chromatography Experiments 179

## **PART FIVE Volumetric Methods of Measurement 185**

### **9. Principles of Volumetric Analysis 186**

- 9.1 General Principles 187
- 9.2 Calculations 189

### **10. Acid-Base Equilibria 203**

- 10.1 Acid-Base Equilibria in Water 204
- 10.2 The pH Scale 206
- 10.3 Weak Acids and Bases 210
- 10.4 Buffers 211
- 10.5 Salts of Weak Acids and Bases 215
- 10.6 Polyprotic Acids and Their Salts 218
- 10.7 Physiological Buffers 220

### **11. Acid-Base Titrations 225**

- 11.1 Strong Acid Versus Strong Base 226
- 11.2 Detection of the End Point: Indicators 227
- 11.3 Weak Acid Versus Strong Base and Weak Base Versus Strong Acid 230
- 11.4 Titration of Sodium Carbonate 234
- 11.5 Mixture of Acids or Bases 236
- 11.6 Kjeldahl Analysis 238
- 11.7 Preparation of Standard Acid and Standard Base Solutions 240

### **12. Nonaqueous Titrations 250**

- 12.1 Acid-Base Theories 251
- 12.2 Classification of Solvents 253
- 12.3 Requirements for Titrations 255
- 12.4 Titrations 256

- 12.5 The Karl Fischer Titration of Water 262

### **13. Precipitation and Complexometric Titrations 268**

- 13.1 Precipitation Titrations 269  
13.2 Complexometric Titrations 274

### **14. Reduction-Oxidation Titrations 295**

- 14.1 Balancing Reduction-Oxidation Reactions 296  
14.2 Theory 299  
14.3 Titration Curves 308  
14.4 Detection of the End Point 310  
14.5 Formal Potential 312  
14.6 Limitations of Electrode Potentials 313  
14.7 Some Redox Titrations 314  
14.8 Preparation of the Analyte Solution 320

## **PART SIX Electrical Methods of Measurement 333**

### **15. Potentiometry and Potentiometric Titrations 334**

- 15.1 Debye-Hückel Theory 335  
15.2 Potentiometric Measurements 337  
15.3 pH Measurements 348  
15.4 Ion-Selective Electrodes 356  
15.5 Potentiometric Titrations 364

### **16. Electrolytic Methods 382**

- 16.1 Electrogravimetry 383  
16.2 Coulometry 386  
16.3 Polarography 390  
16.4 Amperometric Titrations 404

## **PART SEVEN Optical Methods of Measurement 415**

### **17. Spectrometry**

- 17.1 Principles 417  
17.2 Instrumentation 437  
17.3 Limitations of Spectrometry 447  
17.4 Fluorescence 451

### **18. Atomic Spectroscopic Methods 467**

- 18.1 Emission Spectroscopy 468  
18.2 Flame Emission Spectrophotometry 470  
18.3 Atomic Absorption Spectrophotometry 471

## **PART EIGHT Measurements Based on Rate 487**

### **19. Kinetic Methods of Analysis 488**

- 19.1 Kinetics 489  
19.2 Catalysis 491  
19.3 Enzyme Catalysis 494

### **20. Radiochemical Methods of Analysis 511**

- 20.1 Radioactive Disintegration 512  
20.2 Detection of Radiation 516  
20.3 Counting of Different Emitters 521  
20.4 Applications of Radioactivity 528  
20.5 Radiation Safety 532

## **PART NINE Gas Measurements 537**

### **21. Gas Analysis 538**

- 21.1 The Van Slyke Manometric Apparatus 539

- 21.2 The Warburg Apparatus 542
- 21.3 The Dumas Nitrogen Apparatus 542
- 21.4 The Oxygen Electrode 542
- 21.5 The Blood Gas Analyzer 545
- 21.6 Analysis of Particulate Matter in Air 545

## **PART TEN Automation in the Laboratory 549**

### **22. Automation in the Laboratory 550**

- 22.1 Automatic Methods of Analysis 551
- 22.2 Semi-Automatic Instruments 557
- 22.3 Continuous Analysis 558

## **PART ELEVEN Applications of Analytical Chemistry 559**

### **23. Clinical Chemistry 560**

- 23.1 The Composition of Blood 561
- 23.2 Collection and Preservation of Samples 561
- 23.3 Clinical Analysis 564
- 23.4 Radioimmunoassay 565
- 23.5 Physiological Significance of Clinical Tests 573
- 23.6 Enzymes in Diagnosis 576
- 23.7 Trace Elements in the Body 578

### **24. Drug Analysis: Narcotics and Dangerous Drugs 583**

- 24.1 Classification of Drugs 584
- 24.2 Gas Chromatography Screening 587

- 24.3 Thin-Layer Chromatography Screening 590
- 24.4 Spectrophotometric Methods of Measurement 593

## **25. Pollution Analysis 597**

- 25.1 Air Analysis 598
- 25.2 Water Analysis 607

## **Appendix A. Literature of Analytical Chemistry 623**

## **Appendix B. Review of Mathematical Operations: Exponents, Logarithms, and Calculators 626**

## **Appendix C. Tables of Constants 630**

Table C.1 Dissociation Constants for Acids 631

Table C.2 Dissociation Constants for Bases 631

Table C.3 Solubility Product Constants 632

Table C.4 Formation Constants of Metal-EDTA Chelates 633

Table C.5 Some Standard and Formal Electrode Potentials 634

## PRINCIPLES OF ANALYTICAL CHEMISTRY

# CHAPTER One

---

## Introduction

Analytical chemistry can be thought of as comprising two branches, qualitative and quantitative. Qualitative analysis deals with finding what constituent or constituents are in an analytical sample, and quantitative analysis deals with the determination of how much of a given substance is in the sample. In the latter case, a history of the sample composition will generally be known; or else the analyst will have performed a qualitative test. With today's instrumentation and with the large variety of chemical measurements available, specificity or sufficient selectivity<sup>1</sup> can often be achieved so that the quantitative measurement serves as a qualitative measurement. However, simple qualitative tests are usually more rapid than quantitative procedures.

Qualitative analysis is composed of two fields: inorganic and organic. The former is usually covered in introductory chemistry courses, whereas the latter is best left until after the student has had a course in organic chemistry. This text deals principally with quantitative analysis. In the consideration of applications of different techniques, emphasis is placed on situations that the life scientist may be expected to encounter. However, discussions are sufficiently broad to include other areas of general interest.

## 1.1 THE ANALYTICAL PROCESS

The analytical process involves a logical sequence: (1) defining the problem, (2) obtaining and dissolving the sample, (3) performing the required separations, (4) making the appropriate measurements, and (5) data presentation. The unit operations of analytical chemistry that are common to most types of analyses are considered in more detail below.

### 1.1.1 Defining the Problem

In defining the analytical problem, the analyst asks himself such questions as: What information is required? How sensitive must the method be? How accurate and precise<sup>2</sup> must it be? What interferences are likely and what separations are required? How soon must the results be available? How many samples must be run? What equipment is available? What is the cost?

Examples of the manner in which the analysis of particular types of samples are made are given in Chapters 23-25 at the end of the text. These chapters describe commonly performed clinical, drug, and pollution analyses. The various techniques described in this text are utilized for the specific analyses. Hence, it will be useful for you to read through these chapters after completing the majority of this course to gain an appreciation of what goes into analyzing real samples and why the analyses are made.

---

<sup>1</sup>A clear distinction should be made between the terms *specific* and *selective*. A specific reaction or test is one that occurs only with the substance of interest, while a selective reaction or test is one that can occur with other substances but exhibits a degree of preference for the substance of interest. Few reactions are specific but many exhibit selectivity.

<sup>2</sup>Accuracy is the degree of agreement between a measured value and a true value. Precision is the degree of agreement between replicate measurements of the same quantity and does not necessarily imply accuracy. These terms are discussed in more detail in Section 4.3.
