Finite Element Method and its Applications

Preface

During the past decades, giant needs for ever more sophisticated mathematical models and increasingly complex and extensive computer simulations have arisen. In this fashion, two indissoluble activities, mathematical modeling and computer simulation, have gained a major status in all aspects of science, technology, and industry. Since the partial differential equations are very important in the theory and practice, mathematicians, physicians and scientists and engineer pay greatly attention to its numerical computations. In this background, Finite element method, as numerical computational methods for solving partial differential equations is established to occur in last century. Within only a few decades, this technique has evolved from one with initial applications in structural engineering to a widely utilized and richly varied computational approach for many scientific and technological areas.

Finite Element; perhaps no other family of approximation methods has had a greater impact on the theory and practice of numerical methods during the twentieth century. Finite element methods have now been used in virtually every conceivable area of engineering that can make use of models of nature characterized by partial differential equations. There are dozens of textbooks, monographs, handbooks, memoirs, and journals devoted to its further study; numerous conferences, symposia, and workshops on various aspects of finite element methodology are held regularly throughout the world. There exist easily over one hundred reference on finite elements today, and this number is growing exponentially with further revelations of the power and versatility of the method. Today, finite element methodology is making significant inroads into fields in which many thought were outside its realm, for example computational fluid dynamics. In time, finite element methods may assume a position in this area of comparable or greater importance than classical finite difference schemes which have long dominated the subject.

As well known, the nature phenomenon can be described by instantaneous and local or global and process methodology. Two difference methodologies describe the same nature phenomenon. A main task of computational mathematics is making transformation from infinite dimensional space into an finite dimensional space, transform a continuum problem into a finite dimensional system of a discrete structure. Finite element is that a field function of infinite dimensional continuum is instead by a finite dimensional system consists of a piecewise polynomials. This means that the base functions of finite element subspace are a system of functions

with finite support. Variational formulation shows the relationship any different two local points, an energy of each other acting from two different field functions which can be described by bilinear form $B(\varphi_i, \varphi_j)$ where φ_i, φ_j are based functions associated with different point.

The first part(chapter 1-3) of this book provides computational aspect of the method, second part(chapter 4,5), the mathematical background to the finite element methods and the mathematical fundamental to the method are explored, third part (chapter 6) provides nonstandard finite element method, fourth part (chapter 7-9) is concerning applications to elastic mechanics, fluid mechanics, electro-magnetic field and some engineering problems. The book should not only provide mathematical aspect, computational construct of the method and engineering application, but also it should provide a useful starting point for further research.

Contents

Chapter 1	The Structure of Finite Element Method	1
1.1	Galerkin Variational Principle and Ritz Variational Principle	1
1.2	Galerkin Approximation Solution	7
1.3	Finite Element Subspace	10
1.4	Element Stiffness and Total Stiffness	18
Chapter 2	Elements and Shape Functions	21
2.1	Rectangular Shape Function	23
2.1.1	Lagrange Type Shape Function of Rectangular	24
2.1.2	Hermite Type Shape Function of Rectangular	27
2.2	Triangular Element	29
2.2.1	Area Coordinate and Volume Coordinate	30
2.2.2	Lagrange Type Shape Function of Triangular Element	35
2.2.3	Hermite Type Shape Function of Triangular Element	40
2.3	Shape Function of Three Dimensional Element	48
2.3.1	Lagrange Type Shape Function of Hexahedron Element	48
2.3.2	Lagrange Type Shape Function of Tetrahedron Element	50
2.3.3	Shape Function of The Three Prism Element	51
2.3.4	Hermite-Type Shape Function of Tetrahedron Element	52
2.4	Iso-parametric Finite Element	53
2.5	Curve Element	56
Chapter 3	Procedure and Performance of Computation of Finite Element Method	60
3.1	The Procedure of Finite Element Computation	60
3.2	One dimensional Store of Symmetric and Band Matrix	66
3.3	Numerical Integration	69
3.4	Computation of Element Stiffness Matrix and Synthesis of Total Stiffness Matrix	72
3.4.1	Computation of Shape Function	72
3.4.2	The Computation of Element Stiffness Matrix and Element Array	76
3.4.3	Superposition of Elements of Total Stiffness Matrix	78

3.5	Direct Solution Method for Finite Element Algebraic Equations	79
3.5.1	Decomposition for Symmetric and Positive Definition Matrix	80
3.5.2	Direct Solution for Algebraic equations	82
3.6	Other Solution Method for Finite Element Algebraic Equations	85
3.6.1	The Steepest Descent Method	85
3.6.2	Conjugate Gradient Method	87
3.7	Treatment of Constraint Conditions	89
3.7.1	Treatment of Imposed Constraint Conditions	89
3.7.2	Treatment of Periodic Constrains Condition	92
3.7.3	Remove Periodic Constrains and Matrix Transformation	92
3.7.4	Performance of the Method on Computer	95
3.8	Calculation of Derivatives of Function	98
3.9	Automatic Generation of Finite Element Mesh	100
Chapter 4	Sobolev Space	104
4.1	Some Notations and Assumptions on Domain Ω	104
4.2	Classical Function Spaces	105
4.3	$L^p(\Omega)$ Space	107
4.4	Spaces of Distribution	109
4.5	Sobolev Spaces with Integer Index	111
4.6	Sobolev Space with a Real Index $H^{\sigma,p}(\Omega)$	113
4.7	Embedding Theorem and Interpolate Inequalities	114
4.8	The Trace Spaces	116
Chapter 5	The Variational Principle for Elliptic Boundary Value Problem and Error Estimate of Finite Element Approximation Solution	126
5.1	Elliptic Boundary Value Problem	126
5.1.1	Regularity	127
5.1.2	The Existence and Uniqueness of the Solution	128
5.1.3	Maximum Principle	129
5.2	Variational Formulations	130
5.3	Finite Element Approximation Solutions	141
5.4	Coordinate Transformation and Equivalent Finite Element	143
5.4.1	Affine Transformation and Affine Equivalent Finite Element	143
5.4.2	Isoparametric Transformation and Isoparametric Finite Element	144
5.5	The Theory of Finite Element Interpolation	149
5.5.1	Some Lemma	149

5.5.2	Interpolation Accuracy of Affine Equivalent Finite Element	149
5.5.3	Interpolation Accuracy of Isoparameter Finite Elements	151
5.5.4	Finite Element Interpolation of C^1 Type Finite Element	152
5.6	Accuracy of Finite Element Approximation Solutions for Elliptic Boundary Value Problem	152
5.6.1	Conforming Finite Element	152
5.6.2	Theorem on Convergence	154
5.6.3	Aubin-Nitsche Lemma and Estimates of the Norm of L^2	155
5.6.4	The Estimate of Norm with Negative Order	157
5.7	Estimates of the Errors $ u - u_{-h} _{0,\infty,\Omega}$ and $ u - u_h _{1,\infty,\Omega}$	157
5.7.1	Inverse Assumptions	158
5.7.2	Weight Semi-Norm	160
5.7.3	Project Operator	163
5.7.4	Estimates of the Maximum Norm	171
5.8	The Effect of Numerical Integral	171
5.8.1	The Quadrature Scheme For Stiffness Matrix and Right Column	173
5.8.2	The Ellipticity of Discrete Bilinear Form	175
5.8.3	Abstract Error Estimates, The First Strang Lemma	178
5.8.4	Estimate of the Error $\ u - \tilde{u}_h\ _{1,\Omega}$	178
Chapter 6	Nonstandard Finite Element Methods	186
6.1	Abstract and Continuous Mixed Problems	186
6.2	Some Examples	190
6.2.1	Mixed Methods for Two-Order Boundary Value Problems	190
6.2.2	Hybrid Methods for Two-Order Boundary Value Problems	191
6.2.3	Stokes Problem	192
6.2.4	Biharmonic Problem	192
6.3	Approximation Problems	194
6.4	Hybrid Finite Element Methods for Two-Order Boundary Value Problems	199
6.4.1	Hybrid Finite Element Approximation	199
6.4.2	Existence and Uniqueness of Approximation Solution	204
6.4.3	Error Estimates	206
6.4.4	Some Examples	210
6.5	Discontinuous Finite Element and Space $H^m(h)$	211
6.6	Properties of Space $H^m(h_l)$	220
6.7	Nonconforming Approximation for the Variational Problems	232

6.8	Application Examples	241
6.8.1	Wilson Element	241
6.8.2	Adini Element	243
6.8.3	Crouzeit-Raviart Element	245
6.8.4	Morley Element	247
6.8.5	Deveubeke Element	248
6.8.6	Garey Element	249
Chapter 7	Applications of Finite Element Method in the Engineering	250
7.1	The Differential Equations in the Continuum Mechanics	250
7.1.1	Strain Tensor and Strain Rate Tensor	250
7.1.2	The Cauchy Stress Tensor	252
7.1.3	The Dependency of the Stress Tensor on the Strain Tensor—— Constitutive Equation	254
7.1.4	The Relationship between the Stress Tensor and Stain Rate Tensor—— Constitutive Equation for Fluid Mechanics	256
7.1.5	The Gaussian Formula for the Tensor τ^{ij} of order 2	257
7.1.6	The Law of Conservation in Continuum Mechanics	257
7.1.7	The elastic Energy and Lamé Equations in the Elastic Mechanics	258
7.1.8	Partial Differential Equations in Fluid Mechanics	259
7.2	Displacement Method in Elastic Mechanics	265
7.2.1	Galerkin Variational Problem and Principle of Minimal Potential Energy	265
7.2.2	Finite Element Approximate Solution	267
7.2.3	The Case of Cartesian Coordinate and Axi-Symmetry	269
7.3	Finite Element Method in Modern Beam Engineering	269
7.3.1	3D Beam Problem Decomposed into a Coupling System of 1D Subproblem and 2D Subproblem	269
7.3.2	Finite Element Equations of 1D Sub-Problem	274
7.3.3	The Case of Variable Transverse Section	275
7.3.4	Treatment of Strengthen Ribs	277
7.4	S -Coordinate System	281
7.4.1	Metric Tensor and Permutation Tensor	282
7.4.2	Christoffel Symbols	284
7.4.3	Covariant Derivatives	285
7.4.4	Perpendicular Frame on the Surface	287
7.5	Finite Element Analysis for the Elastic Shell	287

7.6	Finite Element Approximation for the Eigenvalue Problem of Nuclear Diffusion Equations	309
7.6.1	General Eigenvalue Problem and An Iterative Method	311
7.6.2	An Acceptive Convergence Method of Iterative	314
7.6.3	Computational Examples	314
7.7	Finite Element Approximation for the Maxwell Equations in Electro-Magnetic Field	317
7.7.1	Maxwell Equation	317
7.7.2	Electric Potential and Magnetic Potential	319
7.7.3	Wave Equation	319
7.7.4	Stationary Magnetic Field in the Iron-Magnetism Media	321
7.7.5	Variational Formulations	322
7.8	Boundary Finite Element Method for the Scattering Problem of Electromagnetic Wave	325
7.9	Coupling Method of Finite Element and Boundary Element for Radiation Problem	330
7.9.1	There Exists a Unique Solution of Problem (7.9.2)	332
7.9.2	Coupling Variational Problem	333
7.9.3	The Well-Posedness of Coupling Variational Problem	334
7.9.4	Finite Element-Boundary Element Approximation for the Coupling Variational Problem	339
7.9.5	Computational Examples	341
Chapter 8	Finite Element Analysis for Internal Flow in Turbomachine	345
8.1	3D Internal Flow in Turbomachine	345
8.1.1	Time Function Space	347
8.1.2	Variational Problem	347
8.1.3	The Discretization	349
8.1.4	Inviscid Flow	351
8.2	The Stream Function Method on Arbitrary Stream-Surface of Turbomachine	352
8.2.1	Stream Function on Arbitrary Stream-Surface	353
8.2.2	Differential Equation for Stream Function on Arbitrary Stream-Surface	356
8.2.3	Circulation Density and Angular Velocity	358
8.2.4	Example	359
8.2.5	Physical Components of Velocity	360
8.2.6	Computation of the Boundary Conditions	360

8.3	The Generation of One-Parameter Stream-Surface Family	363
8.4	Finite Element Approximation	365

Chapter 1

The Structure of Finite Element Method

The finite element method is a numerical computational method for differential equations and partial differential equations. In order to solve the general field problem by using finite element method, it must pass through the following processes:

- 1) Find the variational formulation associated with original field problem.
- 2) Establish finite element subspace. For example, select the element type and associated phase functions.
- 3) Establish element stiffness matrix, element column and assemble global stiffness matrix-full column.
- 4) Treatment of the boundary conditions and solving of the system of finite element equations.
- 5) Come back to the real world.

In this book, the first four processes will be systematic formulations in the first chapter till third chapter.

1.1 Galerkin Variational Principle and Ritz Variational Principle

As an example, we consider the linear elliptic boundary value problem of two dimension,

$$\left\{ \begin{array}{l} - \left[\frac{\partial}{\partial x} \left(p(x, y) \frac{\partial u}{\partial x} \right) + \frac{\partial}{\partial y} \left(p(x, y) \frac{\partial u}{\partial y} \right) \right] = f(x, y), \\ u|_{\Gamma_1} = 0, \\ \left[p(x, y) \frac{\partial u}{\partial n} + \sigma(x, y)u \right]_{\Gamma_2} = g(x, y), \end{array} \right. \quad (1.1.1)$$

where, Ω is a connected domain in R^2 , $\partial\Omega = \Gamma_1 \cup \Gamma_2$ is a piecewise smooth boundary. Let $\mathbf{n}$ denote the unit outward normal vector to $\partial\Omega$ defined almost everywhere on $\partial\Omega$. $p(x, y) \in C^1(\Omega)$, $p(x, y) \geq p_0 > 0$, $\sigma(x, y) \in C^0(\Omega)$ and $\sigma(x, y) \geq 0$.

Throughout this chapter we make notation: $C^0(\Omega)$ = the set of all continuous function in an open subset in R^n . $C^k(\Omega)$ = the set of functions $v \in C^0(\Omega)$, whose derivatives of order $\leq k$, exist and are continuous;

$$D^\alpha = D_1^{\alpha_1} \cdots D_n^{\alpha_n}, \quad D_j = \frac{\partial}{\partial x^j}, \quad D_j^0 = \text{identity},$$

where $\alpha = (\alpha_1, \dots, \alpha_n)$, $|\alpha| = \alpha_1 + \dots + \alpha_n$.

Assume that $u(x, y) \in C^2(\Omega)$ satisfies (1.1.1) in Ω and on $\partial\Omega$, the function $u(x, y)$ is called *classical solution* of problem (1.1.1).

Next, we consider weak solution of (1.1.1). Define the norm

$$\|u\|_{1,\Omega}^2 = \iint_{\Omega} (u_x^2 + u_y^2 + u^2) dx dy. \quad (1.1.2)$$

Sobolev space $H^1(\Omega)$ is a closure of $C^\infty(\Omega)$, under the norm (1.1.2) with the inner product

$$(u, v)_1 = \iint_{\Omega} (u_x v_x + u_y v_y + uv) dx dy, \quad (1.1.3)$$

$H^1(\Omega)$ is a Hilbert space which is called *one order Sobolev space*. Let

$$C_0^\infty(\Omega) = \{v : v \text{ is an infinite differentiable function and support of } v \subset \Omega\},$$

$$H_0^1(\Omega) = \text{the closure of } C_0^\infty(\Omega) \text{ under the norm (1.1.2),}$$

it is equivalent to

$$H_0^1(\Omega) = \{v : v \in H^1(\Omega), v|_{\partial\Omega} = 0\}.$$

In addition, let

$$C_\#^\infty(\Omega) = \{v : v \in C^\infty(\Omega), v|_{\Gamma_1} = 0\},$$

$$V(\Omega) = \text{closure of } C_\#^\infty(\Omega) \text{ under the norm (1.1.2),}$$

which is equivalent to

$$V = \{v : v \in H^1(\Omega), v|_{\Gamma_1} = 0\}.$$

It is clear that V is a Hilbert space with inner product (1.1.3). Furthermore,

$$H_0^1(\Omega) \subset V \subset H^1(\Omega).$$

Let us introduce bilinear functional

$$B(u, v) = \iint_{\Omega} (pu_x v_x + pu_y v_y) dx dy + \int_{\Gamma_2} \sigma uv ds, \quad \forall u, v \in H^1(\Omega). \quad (1.1.4)$$

In (1.1.4), fixed u , then $B(u, v)$ is a linear functional of v , while v is fixed, it is a linear functional of u . In other words, suppose $\alpha_1, \alpha_2, \beta_1, \beta_2$ are arbitrary constants, then

$$\begin{aligned} B(\alpha_1 u_1 + \alpha_2 u_2, \beta_1 v_1 + \beta_2 v_2) &= \alpha_1 \beta_1 B(u_1, v_1) + \alpha_1 \beta_2 B(u_1, v_2) \\ &\quad + \alpha_2 \beta_1 B(u_2, v_1) + \alpha_2 \beta_2 B(u_2, v_2), \quad \forall u_1, u_2, v_1, v_2 \in H^1(\Omega). \end{aligned}$$

It is clear that (1.1.4) satisfies
