前　　言

1. “中国地震台网观测报告”是我国地震台网对发生在全世界、特别是发生在中国和邻近地区的地震观测数据的汇编。自1979年起，本报告采用协调世界时（UTC）。采用汉语拼音拼写中国地名和人名、外国地名和人名沿用英文。

2. 本报告列出的震源参数是用VAX/780计算机进行计算修定的。使用的走时表是J-B表^[1]。使用的震相数据除报告中列出的21个一类台外，还有许多国内台和部分国外台的数据。到时残差、总体标准误差和震源参数的标准误差都分别列出。震中位置，除给出经纬度外，还按Elian, Engdahl和Hill^[2,3]划定的地震分区给出了大致的地理位置。应该强调指出，所有地震的地理区域名称仅作位置的参考，不包含任何政治意义。

3. 面波震级Ms的测定，从1966到1982年的“中国地震台网观测报告”都采用北京台1965年的面波震级公式^[5]：

$$Ms = \log(A/T) + \sigma_{PEK}(\Delta)$$

$$\sigma_{PEK}(\Delta) = 1.66 \log(\Delta) + 3.5 \quad (1^\circ < \Delta < 130^\circ)$$

$\sigma_{PEK}(\Delta)$ 比1967年IASPEI(国际地震学与地球内部物理学联合会)推荐的、现已被国际上广泛采用的量规函数

$$\sigma_{IASPEI}(\Delta) = 1.66 \log(\Delta) + 3.3 \quad (20^\circ < \Delta < 160^\circ)$$

在 $\Delta = 20^\circ - 130^\circ$ 的范围内偏高0.2级，用此量规函数测定的Ms比世界上两个最大的台网（国际地震中心ISC使用的全球台网和美国地震情报服务处NEIS使用的WWSSN台网）测报的震级系统地偏高0.2级。此外，量规函数 $\sigma_{PEK}(\Delta)$ 代表的面波衰减 $\Delta^{-1.66}$ 在近距离处($\Delta = 1^\circ - 20^\circ$)过大，使得近距离测得的Ms偏小。尽管如此，为使资料连续，仍给出用它测定的震级，用Ms(PEK)表示。与此同时，也给出文献[6,7]提出的量规函数 $\sigma_{300}(\Delta)$ 测定的震级，用Ms(CHN)表示。

$$\sigma_{300}(\Delta) = 4.0 + 0.14(\Delta/T_p) + \frac{1}{3} \log(\Delta) + \frac{1}{2} \log(\sin\Delta) + \log(T_p) \quad (3^\circ < \Delta < 177^\circ)$$

T_p 是面波最大振幅对应的平均周期。在 $\Delta = 20^\circ - 160^\circ$ 的范围内，量规函数 $\sigma_{300}(\Delta)$ 与IASPEI推荐的量规函数 $\sigma_{IASPEI}(\Delta)$ 一致， $\sigma_{300}(\Delta)$ 具有更大的震中距使用范围，从 $3^\circ - 177^\circ$ 。用它测定的震级Ms与ISC和NEIS测报的震级统计上是一致的^[7]。

4. 近震震级M_L(CHN)的测定，采用葛焕称等人给出的公式^[8-10]

$$M_L = \log A_\mu + R_6(\Delta)$$

$$R_6(\Delta) = \begin{cases} 2.46 & (\Delta \leq 15 \text{ km}) \\ \log(\Delta) + 0.0013\Delta + 1.27 & (15 \text{ km} < \Delta < 1000 \text{ m}) \end{cases}$$

这个量规函数与李希特关于M_L的原始定义在 $\Delta = 100 \text{ km}$ 处保持一致。它与李善邦教授确定的量规函数在最常用的震中距范围内 $\Delta = 50 \text{ km} - 400 \text{ km}$ 也保持一致。仅在 $\Delta < 50 \text{ km}$ 和 $\Delta > 400 \text{ km}$ 有些改进。用此量规函数测定的震级与以往测定的震级没有系统差。

5. 为便于使用和对比，报告中还给出了NEIS测定的面波震级Ms_z(NEIS)和短周期地震仪测定的体波震级mb(NEIS)。

6. 为避免混乱，各种震级之间一律不换算。

7. 报告中的震相符号采用了国际地震电报符号^[4]。为便于使用，请注意下列对照表：

C代表短周期仪记录压缩。

D代表短周期仪记录膨胀。

U代表长周期仪记录压缩。

R代表长周期仪记录膨胀。

$$IPC = +iP \quad EPD = -eP$$

$$PU = +P \quad PKPR = -PKP$$

$$PG = \bar{P} \text{ or } Pg \quad SG = \bar{S} \text{ or } Sg$$

$$PB = P^* \quad SB = S^*$$

$$AP = pP \quad XP = sP$$

$$APKP = pPKP \quad XPKP = sPKP$$

$$XS = sS \quad LG = Lg$$

preface

1. The "Bulletin of Seismological Observations of Chinese Stations" is a summary of the observed data of earthquakes occurring all over the globe, especially those in China and its surrounding regions. Beginning from 1979, observational time and origin time are given in UTC. The names of Chinses places and persons are spelt with Chinese phonetic alphabets while foreign names are all given in English.

2. All focal parameters are processed with a VAX/780 computer. Jeffreys and Bullen's travel time tables are used in this Bulletin^[1]. The observational data, in addition to the data listed in this Bulletin, include that of many other stations inside and outside China for computer revision of parameters. Arrival time residuals, gross standard deviations and standard errors of focal parameters are all listed. The location of every earthquake is expressed by its latitude and longitude, at the same time, is given by the corresponding geographical region proposed by Flinn, Engdahl and Hill^[2,3]. It should be noted that the names used to classify seismic and geographic regions are only references to their locations and does not imply any political significance.

3. The surface wave magnitude Ms given in the "Bulletin of Seismological Observations of Chinese Stations" from 1966 to 1982 have all adopted the calibration function of the Beijing Station (BJI)^[5].

$$Ms = \log(A/T) + \sigma_{PEK}(\Delta)$$

$$\sigma_{PEK}(\Delta) = 1.66 \log(\Delta) + 3.5 \quad (1^\circ < \Delta < 130^\circ)$$

This calibration function in the range $\Delta = 20^\circ - 130^\circ$ is by larger 0.2 than $\sigma_{IASPEI}(\Delta)$ recommended by IASPEI in 1967 which has already been adopted by many nations and seismological institutions in the world, such as ISC and NEIS.

$$\sigma_{IASPEI}(\Delta) = 1.66 \log(\Delta) + 3.3 \quad (20^\circ < \Delta < 160^\circ)$$

Therefore, the magnitude Ms calculated by $\sigma_{PEK}(\Delta)$ is systematically 0.2 units larger than that measured by ISC and NEIS which possess the largest aperture seismic network. The rate of attenuation of surface wave amplitude $\Delta^{-1.66}$ in the range $\Delta = 1^\circ - 20^\circ$ characterized by $\sigma_{PEK}(\Delta)$ is so large that the Ms measured for smaller epicentral distance is too small. In spite of this, in order to maintain continuity of data, the values of Ms computed by $\sigma_{PEK}(\Delta)$ are still given, marked by Ms(PEK). At the same time, the values of Ms computed by the calibration function $\sigma_{300}(\Delta)$ ^[6, 7] are also given, marked by Ms(CHN).

$$\sigma_{300}(\Delta) = 4.0 + 0.14\Delta/T_p + \frac{1}{3}\log(\Delta) + \frac{1}{2}\log(\sin\Delta) + \log(T_p) \quad (3^\circ < \Delta < 177^\circ)$$

where Tp is the average period corresponding to maximum surface wave amplitude,

The $\sigma_{300}(\Delta)$ is consistent with $\sigma_{IASPEI}(\Delta)$ in the range $\Delta = 20^\circ - 160^\circ$ and has a greater useable range of $3^\circ - 177^\circ$ than $\sigma_{IASPEI}(\Delta)$. The values of M_s (CHN) computed by $\sigma_{300}(\Delta)$ agree statistically with those measured by ISC and NEIS^[7].

4. The local magnitude M_L (CHN) is determined with the formula given by Ge Huancheng et al.^[8-10].

$$M_L = \log(A_\mu) + R_6(\Delta)$$

$$R_6(\Delta) = \begin{cases} 2.46 & (\Delta \leq 15 \text{ km}) \\ \log(\Delta) + 0.0013\Delta + 1.27 & (15 \text{ km} < \Delta < 1,000 \text{ km}) \end{cases}$$

This calibration function is consistent with Richter's original definition of local magnitude M_L at $\Delta = 100 \text{ km}$, and consistent with that determined by professor Lee Shanbang (S.P.Lee) in the most used range $\Delta = 50 - 400 \text{ km}$. There is only some improvement for $\Delta < 50 \text{ km}$ and $\Delta > 400 \text{ km}$. So the local magnitudes measured in this Bulletin have no systematic difference with that measured in the past.

5. For convenience of use and comparison, the surface wave magnitude M_{sz} (NEIS) and body wave magnitude m_b (NEIS) measured by NEIS recorded on short period seismograph, are also listed in this Bulletin.

6. In order to avoid confusion, no conversion is made among the various magnitudes.

7. The Bulletin is compiled with international earthquake telegraphic symbols to present seismic phase^[4]. For convenience, a short reference table is given. C represents compression and D represents dilation recorded on short period seismographs. U represents compression and R represents dilatation recorded on long period seismographs, such as

$IPC = +iP$	$EPD = -eP$
$PU = +P$	$PKPR = -PKP$
$PG = \bar{P}$ or Pg	$SG = \bar{S}$ or Sg
$PB = P^*$	$SB = S^*$
$AP = pP$	$XP = sP$
$APKP = pPKP$	$XPKP = sPKP$
$XS = sS$	$LG = Lg$
