## 前言

自1966年至1970年期间的中国地震台网观测读数，没有汇编成用于国际交流的地震台网观测通报。1985年决定补编这段时期的资料，有关补编的宗旨和作法已在1987年《国际地震动态》第9期作了介绍<sup>[3]</sup>。

本通报列出的地震参数，没有重新修定。国内及边境地区地震，一般给出两组数，第一组引自中国地震目录<sup>[4]</sup>，第二组引自BISC<sup>[5]</sup>，以资对比。国外远震仅一组数，为BISC的结果；还有少部分地震列出了三组数，第一组引自文献[4]，第二组为区域台网测定结果（例如云南省区域台网），第三组为BISC测定结果。使用的时间为世界时(UT或CMT)，地震走时表为J-B表<sup>[6]</sup>。

关于震级，凡大于5小于6者，为北京(BJI)，拉萨(LSA)，和乌鲁木齐(WM)三台的平均值或某一台的测定结果；大于等于6者，列出几组结果：M(ISC)表示BISC给出的震级，它不区分体波震级和面波震级；MB1和MS1表示引自世界地震目录的结果<sup>[5]</sup>；MB2和MS2表示本通报重测结果。测定震级的公式如下：

$$MB=1.59m-3.97$$

$$m=\log\left(\frac{A}{T}\right)+Q(\Delta, h)$$

$$MS=\log\left(\frac{A}{T}\right)\max + \sigma(\Delta)$$

$$\sigma(\Delta)=1.66\log\Delta+3.5$$

报告中的震相符号参考了国际地震电报符号。请注意对照表： $PG=\bar{P}$  或  $Pg$ ;  $SG=\bar{S}$  或  $Sg$ ;  $CG=\pi g$ ;  $PB=P^*$ ;  $SB=S^*$ ;  $AP=pP$ ;  $APKP=pPKP$ ;  $XP=sP$ ;  $XPKP=sPKP$ ;  $XS=sS$ ;  $XSKS=sSKS$ 。 $Sr$ 为20°间断面以下的折射波震相。 $P$ 后无到时读数，而后接地动位移和相应周期，表示 $P$ 的初始前半个周期的振幅和相应周期。 $P_m$ ， $PP_m$ ， $S_m$ 分别为 $P$ 波， $PP$ 波和 $S$ 波的最大振幅。 $Q_m$ 和 $R_m$ 分别为勒夫波和瑞利波的最大振幅。 $L_m$ 为面波在水平向的最大振幅，不能分辨为勒夫波或瑞利波。

本汇编的最后部分“附录”，给出了北京台、乌鲁木齐台和拉萨台的台站读数，其中不包括已有定位的地震读数。

在工作中得到各省市自治区地震局资料室和地震台站以及国家地震局科技监测司的协助和支持；得到本所资料室张碧琴、陈美秀、黄中元、王明德、刘建立的帮助。这项工作得到

宋仲和、时振梁的支持和指导。在此，对以上各有关机构和同志们表示感谢。

## 1966 年地震观测资料汇编工作人员

主 编： 陈培善。  
编 者： 赵荣国为汇编和总校核，陈海通和王敬贤部分资料整理，赵荣国、王淑贞、付禹、张相民、周来顺、张占田、张宏志、谢俊英、孙静华、张立明等分析地震图。  
计 算： 曹学锋、李文香。

Compiling personnel of the observed seismological data in 1966

Editor-in-Chief: Chen Peishan.

Managing editor: Zhao Rongguo.

Analysts and revisers of seismic phase: Zhao Rongguo, Chen Haitong, Wang Jingxian, Wang Shuzhen, Fu Yu, Zhang Xiangmin, Zhou Laishun, Zhang Zhantian, Zhang Hongzhi, Xie Junying, Sun Jinghua, Zhang Liming.

Calculator: Cao Xuefeng and Li Wenxiang.

## Preface

The observed seismological data of Chinese stations during 1966-1970 years had not been compiled into "Bulletin of Seismological Observations of Chinese Stations" to be used for exchange. A decision had been made in 1985 year to compile these Bulletins. The compiled aim and method are presented in "Recent Developments in World Seismology" of 1987<sup>[3]</sup>.

All of focal parameters in this Bulletin are not revised again. Two sets of parameters are given for the earthquakes occurred in China and its surrounding regions, the first one comes from "The Catalogue of the Chinese Earthquakes"<sup>[4]</sup>, the second is quoted from BISC<sup>[2]</sup>, to be compared with each other. There is only one for the distant earthquake outside China, it is the result of BISC. Three set of parameters are given for a few of earthquakes, the first one is quoted from reference [4], the second is the result measured by local network ( such as seismic network of Yunnan province ), the third is the result of BISC. The observational time and origin time are given in universal time ( UT or GMT ) The travel time tables used in the Bulletin are Jeffreys and Bullen's<sup>[1]</sup>

The magnitude for such earthquakes  $5 < M < 6$  is an average over three stations of BJI, LSA and WMQ, or a measurement of only one station. There are several results for such earthquake  $M \geq 6$ :  $M_{(ISC)}$  is the result BISC,  $M_{BI}$  and  $M_{SI}$  are quoted from "World Catalogue of Earthquakes"<sup>[5]</sup>,  $M_{B2}$  and  $M_{S2}$  are measured by us again. The surface wave magnitude  $M_s$  and body wave magnitude  $M_B$  are determined according to the following formulas

$$M_B = 1.59m - 3.97$$

$$m = \log(A/T) + Q(\Delta, h)$$

$$M_s = \log(A/T)_{\text{max}} + \sigma(\Delta)$$

$$\sigma(\Delta) = 1.66 \times \log \Delta + 3.5$$

The phases in the Bulletin refer to international earthquake telegraphic

symbols, the short references are following: PG=  $\bar{P}$  or Pg, SG=  $\bar{S}$  or Sg, CG=  $\bar{g}$ , PB=  $\bar{P}^0$ , SB= S, AP= pP, APkP= pPKP, XP= sP, XPKP= sPKP, XS= sS, XSks= sSKS. Sr is a refraction phase under 20° discontinuity. The ground displacement and its period listed after the P phase without P arrival time represent onset amplitude and its period. Pm, PPm and Sm are the maximum amplitude of P, PP and S wave, respectively. Qm and Rm are the maximum amplitude of Love and Rayleigh surface wave, respectively. Lm is the maximum amplitude of surface wave on horizontal component, disregarding Love or Rayleigh waves.

The appendix in the last part of the Bulletin is observed data of three stations of BJI WMQ and LSA, excluding data which have been used to locate earthquake.

The authors wish to express their sincere thank to the Department of Scientific Programming and Earthquake Monitoring, SSB, every Provincial Seismological Bureau in China for their constant support and assistance, and Song Zhong-he, Shi Zhenliang for their advice and encouragement.
