# Preface

This book addresses the fundamental principles of satellite communications. Although most materials deal with digital systems, analog systems are also treated in detail. The book is written at a level suitable for use by seniors and first-year graduate students in electrical engineering. Examples are used throughout the text to help students develop a good understanding of the subject. Because the material in each chapter is independent or nearly independent of each other, the book provides full flexibility for the instructor. For a senior course I suggest Chapters 1–5 (one quarter) or Chapters 1–6 with selected materials in Chapter 7 (one semester). For a first-year graduate course, Chapters 6–9 are appropriate for one quarter, and Chapters 6–11 for one semester. The end-of-chapter problems are an important and integral part of the book. They are intended not only to help students test their comprehension of the subject but also to extend the discussion sometimes made brief because of the page constraint. A list of symbols and a list of acronyms are provided to make reading more pleasant.

Because satellite technology is a big picture, it is impossible to cover all topics in a book of this length. Therefore, I have focused only on fundamental principles, and I have tried to keep the mathematics to a minimum level. Advanced concepts of satellite communications are referred to in appropriate references. I hope that this book on satellite communications will serve students and satellite engineers well.

It would not have been possible for me to complete this book without the direct and indirect help of many persons, whom I wish to acknowledge. Professor D. B. Hodge (EE Department Head) provided a light teaching load in my first year at VPI&SU. Professor C. W. Bostian (Clayton Ayre Professor and Head of Satellite Communication Group) has given me the opportunity to work in satellite projects. Professor S. Haykin (McMaster University) and Professor L. Couch II (University of Florida) reviewed the book and offered many valuable comments. T. Battle, A. Bennani, N. Miles, and W. Wattaal provided supporting materials; Tuan Ha helped on TDMA. I also wish to thank Professor R. W. Newcomb for being an academic mentor during my graduate career at the University of Maryland. Finally, I wish to thank my wife Hien, to whom this book is dedicated, for typing and retyping the manuscript. Her support and encouragement during the past three years made this project possible.

# List of Acronyms

ACU:	antenna control unit
ARFA:	assisted receive frame acquisition
AWGN:	additive white Gaussian noise
BPF:	bandpass filter
CCIR:	International Radio Consultative Committee
CCITT:	International Telegraph and Telephone Consultative Committee
CCR:	carrier and clock recovery
CDMA:	code division multiple access
CONUS:	Continental United States
CSC:	common signaling channel
DA-FDMA:	demand assignment–frequency division multiple access
DA-TDMA:	demand assignment–time division multiple access
DAMA:	demand assignment multiple access
DAU:	data acquisition unit
DBS:	direct broadcasting satellite
DC:	downconverter
DS:	direct sequence
DS-CDMA:	direct sequence–code division multiple access
DSI:	digital speech interpolation
EIRP:	effective isotropic radiated power

EQL:	equalizer
FCC:	Federal Communication Commission
FDM:	frequency division multiplexing
FDMA:	frequency division multiple access
FH:	frequency hop
FH-CDMA:	frequency hop-code division multiple access
FM:	frequency modulation
FSK:	frequency-shift keying
HPA:	high-power amplifier
IF:	intermediate frequency
INTELSAT:	International Telecommunications Satellite Organization
ITU:	International Telecommunication Union
LNA:	low-noise amplifier
LO:	local oscillator
LPF:	low-pass filter
M&C:	monitoring and control
M-ary FSK:	<i>M</i> -ary frequency-shift keying
M-ary PSK:	<i>M</i> -ary phase-shift keying
MSK:	minimum shift keying
MTTF:	mean time to failure
MTTR:	mean time to repair
NCC:	network control center
OMT:	orthogonal mode transducer
OQPSK:	off-set quaternary phase shift keying
PCM:	pulse code modulation
PLL:	phase-locked loop
PN:	pseudo-noise
PRB:	primary reference burst
PRS:	primary reference station
PSK:	phase-shift keying
QPSK:	quaternary phase-shift keying
RBT:	receive burst timing
RF:	radio frequency
RFA:	receive frame acquisition
RFS:	receive frame synchronization
RFT:	receive frame timing
SB:	short burst
SCPB:	single channel per burst
SCPB-DAMA:	single channel per burst-demand assignment multiple access
SCPC:	single channel per carrier
SCPC-DAMA:	single channel per carrier-demand assignment multiple access

<b>SRB:</b>	secondary reference burst
<b>SRS:</b>	secondary reference station
<b>SS-TDMA:</b>	satellite-switched TDMA
<b>SSB:</b>	superframe short burst
<b>SSB:</b>	single sideband
<b>SSB-AM-FDMA:</b>	single sideband-amplitude modulation-frequency division multiple access
<b>TA:</b>	transmit acquisition
<b>TB:</b>	traffic burst
<b>TBT:</b>	transmit burst timing
<b>TDM:</b>	time division multiplexing
<b>TDMA:</b>	time division multiple access
<b>TFA:</b>	transmit frame acquisition
<b>TFS:</b>	transmit frame synchronization
<b>TFT:</b>	transmit frame timing
<b>TIM:</b>	terrestrial interface module
<b>TRT:</b>	timing and reference transponder
<b>TS:</b>	transmit synchronization
<b>TV:</b>	television
<b>TWTA:</b>	traveling wave tube amplifier
<b>UC:</b>	upconverter
<b>VCO:</b>	voltage-controlled oscillator
<b>WARC:</b>	World Administrative Radio Conference

---

# List of Symbols

$a$ :	orbital radius (42,164.2 km), traffic intensity
$A$ :	amplitude, area, azimuth angle
$b(t)$ :	baseband signal
$B$ :	bandwidth
$B(n,a)$ :	blocking probability
$B_3$ :	3-dB bandwidth
$B_{\text{rms}}$ :	rms bandwidth (10.95)
$BO_i$ :	input back-off
$BO_o$ :	output back-off
$c$ :	light velocity ( $2.997925 \times 10^8$ km/s)
$C$ :	carrier power
$\mathcal{C}$ :	channel capacity
$d$ :	Hamming distance
$d_d$ :	downlink slant range
$d_N$ :	distance from satellite to station $N$
$d_u$ :	uplink slant range
$D$ :	antenna diameter
$D_N$ :	transmit frame delay
$E$ :	elevation angle
$E_b$ :	energy per bit
$E_c$ :	energy per coded bit
$E_s$ :	energy per symbol

$E\{x\}$ :	expected value of $x$
$\text{Erfc}(x)$ :	complementary error function (9.31)
$f$ :	frequency
$F$ :	force, noise figure
$g$ :	gravitational constant, rectangular pulse
$G$ :	antenna gain, channel traffic
$h(t)$ :	impulse response
$H$ :	orbital altitude (35786.045 km), transfer function
$i$ :	inclination angle
$I$ :	interference power
$I_n(x)$ :	modified Bessel function of order $n$ of the first kind
$j$ :	imaginary number, summation index, product index
$J$ :	jamming power
$J_0$ :	jamming density
$J_n(x)$ :	Bessel function of order $n$ of the first kind
$k$ :	Boltzmann constant ( $1.38 \times 10^{-23}$ J/K), information block length in a codeword, number of users in DS-CDMA
$K$ :	degree Kelvin, randomized interval
$\ln$ :	natural logarithm
$\log$ :	logarithm of base 10
$\log_2$ :	logarithm of base 2
$L$ :	length, power loss
$L_a$ :	atmospheric attenuation
$L_d$ :	downlink free-space attenuation
$L_r$ :	rain attenuation
$L_u$ :	uplink free space attenuation
$m$ :	mass
$M$ :	$M = 2^k$ in $M$ -ary signaling
$n$ :	length of a code word
$N$ :	noise power, processing gain
$\mathcal{N}$ :	effective noise power
$N_0/2$ :	noise power spectral density
$\mathcal{N}_0/2$ :	effective noise power spectral density
$p$ :	transition probability
$p(x)$ :	probability density function of $x$
$P$ :	power
$P_A$ :	availability probability
$P_b$ :	probability of bit error
$P_d$ :	detection probability
$P_F$ :	false alarm probability
$P_s$ :	probability of symbol error
$\text{Pr}\{x\}$ :	probability of $x$
$q$ :	successful probability of a packet
$Q(x)$ :	Gaussian integral (9.29)

$r$ :	distance
$R$ :	reliability, resistance, channel capacity
$R_b$ :	bit rate
$R_e$ :	earth radius (6378.155 km)
$R_p$ :	chip rate
$R_s$ :	symbol rate
$s(t)$ :	signal
$S$ :	channel throughput
$S(f)$ :	power spectral density
$t$ :	error-correcting capability, time
$T$ :	noise temperature
$T_b$ :	bit duration
$T_0$ :	ambient temperature (290 K)
$T_e$ :	equivalent noise temperature
$T_f$ :	frame length
$T_R$ :	satellite propagation delay
$T_s$ :	symbol duration, system noise temperature
$u(t)$ :	unit step function
$v$ :	true anomaly
$V$ :	orbital velocity, voltage
$W$ :	aperture window
$X$ :	cross-polarization discrimination, $x$ coordinate
$y(t)$ :	envelope of a burst
$Y$ :	$y$ coordinate
$z$ :	a random variable
$Z$ :	$z$ coordinate
$\alpha$ :	coupling coefficient
$\beta$ :	coupling coefficient
$\beta_{\max}$ :	maximum root mean square of partial cross-correlations
$\gamma$ :	partial cross-correlation
$\Gamma$ :	reflection coefficient
$\delta$ :	duty cycle
$\Delta A$ :	differential attenuation
$\Delta\psi$ :	differential phase
$\epsilon$ :	rms surface error of antenna, threshold of unique word detection
$\eta$ :	antenna efficiency
$\theta$ :	carrier phase, antenna off-axis angle
$\theta_1$ :	earth station latitude
$\theta_L$ :	earth station longitude
$\lambda$ :	wavelength, a constant in Chernoff bound, latitude, arrival rate
$\mu$ :	mean value, mean hang-up rate
$\pi$ :	3.1416

**xxvi** LIST OF SYMBOLS

$\rho$ :	failure rate, traffic intensity
$\rho(\tau)$ :	autocorrelation
$\rho_{nm}$ :	cross-correlation
$\sigma^2$ :	variance
$\tau$ :	time delay
$\phi$ :	carrier phase
$\omega$ :	angular frequency
$\Omega$ :	carrier power flux density
$\Omega_{\text{sat}}$ :	saturation carrier flux density
$x^*$ :	conjugate of $x$
$ x $ :	absolute value of $x$
$\overline{f(t)}$ :	time average of $f(t)$
$f(t) \otimes g(t)$ :	convolution of $f(t)$ and $g(t)$
$\text{Re}(x)$ :	real part of $x$
