PREFACE

For many years there has been a noticeable lack of senior undergraduate texts in igneous petrology that might bridge a gap between, on the one hand, several excellent introductory petrography-orientated texts and, on the other hand, more advanced texts heavily predicated on a thermodynamic and/or chemical approach to the subject. Furthermore, in the last decade and a half, say since the appearance of the prescient synthesis of Arthur Holmes' *Principles of Physical Geology*, second edition, in 1965, we have witnessed a profound re-orientation of igneous petrology in relation to global tectonics. A giant step has been taken in clothing R.A. Daly's historic comment,

"A final philosophy of earth history must be largely founded upon the unshakable facts known about igneous rocks"

with evidence and conclusions from both young and old igneous rocks. Ophiolites, Proterozoic igneous rocks, and a few other conspicuous growth areas apart, we now seem to be entering a relatively quiet period of amassing and interpreting a considerable amount of increasingly sophisticated analytical data about igneous rocks, coupled however with a slackening in the rate of new major advances in synthesis and understanding. Thus at this particular time it seems appropriate to attempt to integrate the structure of recent conceptual advances with the firm foundation provided by classical petrology.

The approach in this book is hence predicated initially on field and other direct observations and on an historical background. This approach leads naturally from observational facts about extrusive and intrusive rocks and a classical mineralogical classification, via differentiation processes married to experimental work, to the evolution of ideas on igneous rock series and the recent explosion of the relationship of these to plate tectonics and inferred mantle processes, and to an indication of some current problematical areas. Students do seem to benefit from an appreciation of the historical path of discovery and evolution of ideas about igneous rocks in order to make intelligible the present body of knowledge and thrust of contemporary research.

I have assumed that a reader of this book will have had some elementary training in the physical sciences and some first courses in geology including introductory petrology, and ideally has access to a good thin-section collection of igneous rock suites and the opportunity to read up or attend parallel courses in relevant aspects of geochemistry and isotope geology.

This approach is well illustrated by the choice of references — a perennial and important problem in texts. Many classic and benchmark papers are included, together with a large number of up-to-date review articles and books, and a selection of more specific papers that the writer personally has found interesting and informative, particularly those which may express contrary or modifying opinions to contemporary conventional wisdom. In so far as this book may fail to achieve a compromise between the desirable attributes of readability, brevity, and information source, the reader may be provoked into reading some of these references. As Gilbert Highet in his *The Art of Teaching* so appositely recommends, there is no comparison between the benefit to be derived from looking up work in the original and that from tamely accepting someone else's commentary.

My advice therefore to readers of this book is to use it as I will — with marginal notes and additions, queries, expressions of dissent, etc., as not only is any book imperfect but also our subject is continually evolving. Any suggestions and rectifications will be gratefully received and acknowledged.

I should like to take this opportunity to record a great debt to teachers and comrades over the years. Foremost among these is my former teacher and supervisor, Professor L.R. Wager. Fashions may change in igneous petrology as in other things, but a man's stature does not. Lawrence Wager, mountaineer and field geologist, perceptive petrographer and innovative thinker, possessed the true scientific knack of being able to apply himself assiduously to important problems capable of a solution at the time. A major part of his legacy to igneous petrology is a now dispersed group of igneous petrologists that received their training under him at Oxford and in the Hebrides and Greenland, and elsewhere. I also recall with great pleasure the camaraderie of geologists over the years in Zambia, Zimbabwe, Union of South Africa, Ghana, Egypt, Morocco, Spain, France, Federal Republic of Germany, Switzerland, Scandinavia, Eire, United Kingdom, U.S.A., Canada, Iceland, India, Nepal, Malaysia, Australia, New Zealand and Japan, and especially the stimulus afforded by undergraduate and graduate students and colleagues at Memorial University of Newfoundland over the last fourteen years.

Among colleagues at MUN I should especially like to thank in the context of this work Glenys Woodland for the major part of the typing with able assistance from Lillian Murphy, Cynthia Neary and Betty Andrews; Clifford Wood, Gary McManus and colleagues for drafting services and advice; and Jeanne Mills, Adele Poynter and George Einarson for help with references. I owe a particular debt to my friend and colleague, Dr. John G. Malpas, for his pains in cheerfully reading the text and making numerous suggestions for improvement despite other heavy claims on his time.

CHARLES J. HUGHES
St. John's, Newfoundland
January 1981

GLOSSARY

Units used in this book and their conversions to SI units:

Concentration	ppb	(parts per billion)		
	ppm	(parts per million)		
	vol. %	(per cent by volume)		
	wt. %	(per cent by weight)		
Energy	cal.	(calorie)	4.184 J	(joule)
Length	Å	(ångström)	10^{-10} m	(meter)
	fathom	(nautical fathom)	1.8288 m	
Mass	t	(metric ton, tonne)	10^3 g	(gram)
Pressure	atm.	(atmosphere)	$1.013 \cdot 10^5$ Pa	(pascal)
	bar		10^5 Pa	
Temperature	°C	(degree Celsius)	K	(kelvin)
Time	day		86,400 s	(second)
	a	(year)	$3.16 \cdot 10^7$ s	
Viscosity	P	(poise)	10^{-5} N m ⁻² s ⁻¹	

S.I. unit prefixes:

μ (micro)	10^{-6}	k (kilo)	10^3
m (milli)	10^{-3}	M (mega)	10^6
c (centi)	10^{-2}	G (giga)	10^9

Abbreviations, acronyms, and symbols used in text:

AFM variation diagram	alkalis: iron oxide: magnesia
An	proportion by weight of anorthite, the higher-temperature component, in the solid-solution series anorthite—albite; for example, An ₈₁ signifies a composition of 81 wt.% anorthite
BABI	basaltic achondrite best initial
CFSE	crystal field stabilization energy
CI	crystallization index
C.I.	colour index
CMAS system	CaO—MgO—Al ₂ O ₃ —SiO ₂
DI	differentiation index
DLVL	depleted low-velocity layer
E	explosion index

En	proportion by weight of enstatite in the solid-solution series enstatite—ferrosilite (see note above on An)
FAMOUS	French American Mid-Ocean Undersea Study
FI	fractionation index

Abbreviations, acronyms, and symbols used in text (continued):

FMA variation diagram	see AFM variation diagram
Fo	proportion by weight of forsterite in the solid-solution series forsterite—fayalite (see note above on An)
h	vertical distance in kilometres to Benioff seismic zone
HREE	heavy rare-earth elements
IAT	island-arc tholeiite
K ₅₅ -value	wt.% K ₂ O in a series at a silica content of 55 wt. %
LIL	large-ion lithospheric
LKT	low-potassium tholeiite
LREE	light rare-earth elements
LVL	low-velocity layer
M-value	100Mg/(Mg + total Fe)
Mg ratio	100Mg/(Mg + Fe ²⁺)
MORB	mid-ocean ridge basalt
OIT	oceanic-island tholeiite
PHMP	primordial hot mantle plume
Q	dimensionless quantity expressing seismic measure of anelasticity within the mantle
REE	rare-earth elements
SBZ	supra-Benioff seismic zone
SI	solidification index
(⁸⁷ Sr/ ⁸⁶ Sr) ⁰	initial ⁸⁷ Sr/ ⁸⁶ Sr ratio

See also general index for references to further explanation and usage in context of the above.

Frequently used abbreviations of normative mineral molecules for CIPW classification:

ab = albite	fo = forsterite	ne = nepheline
ac = acmite	fs = ferrosilite	ns = sodium metasilicate
an = anorthite	hm = hematite	ol = olivine
C = corundum	hy = hypersthene	or = orthoclase
di = diopside	il = ilmenite	Q = quartz
en = enstatite	lc = leucite	wo = wollastonite
fa = fayalite	mt = magnetite	

Chemical symbols and elements:

Ac	actinium	B	boron	Cd	cadmium
Ag	silver	Ba	barium	Ce	cerium
Al	aluminum	Be	beryllium	Cl	chlorine
Ar	argon	Bi	bismuth	Co	cobalt
As	arsenic	Br	bromine	Cr	chromium
At	astatine	C	carbon	Cs	caesium
Au	gold	Ca	calcium	Cu	copper

Chemical symbols and elements (continued):

Dy	dysprosium	Mo	molybdenum	Sb	antimony
Er	erbium	N	nitrogen	Sc	scandium
Eu	europium	Na	sodium	Se	selenium
F	fluorine	Nb	niobium	Si	silicon
Fe	iron	Nd	neodymium	Sm	samarium
Fr	francium	Ne	neon	Sn	tin
Ga	gallium	Ni	nickel	Sr	strontium
Gd	gadolinium	O	oxygen	Ta	tantalum
Ge	germanium	Os	osmium	Tb	terbium
H	hydrogen	P	phosphorus	Tc	technetium
He	helium	Pa	protactinium	Te	tellurium
Hf	hafnium	Pb	lead	Th	thorium
Hg	mercury	Pd	palladium	Ti	titanium
Ho	holmium	Pm	promethium	Tl	thallium
I	iodine	Po	polonium	Tm	thulium
In	indium	Pr	praseodymium	U	uranium
Ir	iridium	Pt	platinum	V	vanadium
K	potassium	Ra	radium	W	tungsten
Kr	krypton	Rb	rubidium	Xe	xenon
La	lanthanum	Re	rhenium	Y	yttrium
Li	lithium	Rh	rhodium	Yb	ytterbium
Lu	lutetium	Rn	radon	Zn	zinc
Mg	magnesium	Ru	ruthenium	Zr	zirconium
Mn	manganese	S	sulphur		

CONTENTS

PREFACE	v
GLOSSARY	vii
CHAPTER 1 — MINERALOGY OF IGNEOUS ROCKS	1
1.1. Introduction.	1
1.2. Chemical considerations	2
1.2.1. The chemical elements	2
1.2.2. Clarkes	6
1.2.3. Valency.	9
1.3. Factors governing structures of silicate minerals	10
1.3.1. Relative abundance of oxygen to cations in igneous and crustal rocks	10
1.3.2. The role of oxygen in the structure of silicate minerals	12
1.3.3. Ionic radii	12
1.3.4. The SiO_4 tetrahedron	14
1.3.5. Resultant silicate structures.	14
1.4. Principles governing crystalline solution.	16
1.5. Nomenclature, composition, and paragenesis of igneous rock-forming minerals	19
1.6. Recognition of minerals in thin section	25
CHAPTER 2 — VOLCANIC ACTIVITY	29
2.1. Introduction.	29
2.2. Volcanic activity described by natural groupings	29
2.2.1. Basalts.	29
2.2.1.1. Subaerial basaltic eruptions	29
2.2.1.2. Subglacial basaltic eruptions	32
2.2.1.3. Submarine basaltic eruptions	33
2.2.2. Andesites.	35
2.2.2.1. Subaerial andesitic eruptions	35
2.2.2.2. Submarine andesitic volcanism.	38
2.2.3. Rhyolites.	39
2.2.3.1. Subaerial rhyolitic lava flows	39
2.2.3.2. Ash flows and recent ignimbrites	39
2.2.3.3. Structure and origin of ignimbrites	42
2.2.3.4. Geologic setting of rhyolite eruption.	44
2.2.3.5. Subaqueous rhyolitic volcanism	48
2.2.4. Kimberlites	50
2.3. Fragmental volcanic rocks.	52
2.3.1. Autoclastic rocks.	52
2.3.2. Pyroclastic rocks.	53
2.3.3. Epiclastic rocks.	56
CHAPTER 3 — FORMS AND STRUCTURES OF INTRUSIVE ROCKS	57
3.1. Introduction.	57
3.2. Basic intrusions into continental crust	58
3.2.1. Dykes	58

3.2.2. Sills	60
3.2.3. Large basic intrusions	63
3.3. Ophiolite association	64
3.4. Subvolcanic and central complexes	69
3.5. Deep-seated granitic rocks	73
3.5.1. Introduction	73
3.5.2. Contrasted approaches of Bowen and Read	74
3.5.3. Granitization defined	75
3.5.4. Approach of Buddington	76
3.5.5. Katazonal granitic rocks	77
3.5.6. Mesozonal granitic rocks	83
3.5.7. Discussion	84
3.6. Features to map and sample in intrusive rocks	85
 CHAPTER 4 — CLASSIFICATION OF IGNEOUS ROCKS	 89
4.1. Introduction	89
4.2. Presentation of compositional data	90
4.2.1. Igneous rock analyses	90
4.2.2. Norms	95
4.2.3. Procedure for calculating the CIPW norm	97
4.3. Reflection of chemistry in mineralogy	100
4.3.1. Silica content	100
4.3.2. Principle of silica saturation	101
4.3.3. Alumina saturation	101
4.3.4. Colour index	102
4.3.5. Feldspar proportions	103
4.4. Classification	103
4.4.1. Occurrence and grain size	103
4.4.2. Rationale of classification adopted in this chapter	104
4.4.3. Aphanitic mafic rocks	105
4.4.4. Aphanitic intermediate and acid rocks	110
4.4.5. Cumulates	112
4.4.6. Other plutonic mafic and ultramafic rocks	113
4.4.7. Granitic plutonic rocks	116
4.4.8. Lamprophyres and kimberlites	120
4.4.9. Carbonatites and associated rocks	122
4.4.10. Spilite and keratophyre	123
 CHAPTER 5 — PETROGRAPHY OF IGNEOUS ROCKS	 125
5.1. Introduction	125
5.2. Procedure	126
5.3. A working vocabulary	128
5.3.1. Terms used in description of igneous processes	129
5.3.2. Terms used to describe structural features of igneous rocks	130
5.3.2.1. Mafic flows	130
5.3.2.2. Intermediate and acid flows	131
5.3.2.3. Layered intrusions	132
5.3.2.4. Katazonal granitic rocks	132
5.3.2.5. Mesozonal granitic rocks	132
5.3.2.6. Epizonal granitic rocks	133
5.3.2.7. Lamprophyres	134
5.3.3. Terms used to describe mineral shapes	134
5.3.4. Terms used for overall mineralogical features	135

5.3.5. Terms of general application used to describe textures	136
5.3.6. Terms used to describe specific intergrain textures.	141
5.3.7. Terms used to describe intragrain textures produced by exsolution.	144

CHAPTER 6 — PHYSICAL PROPERTIES AND PHYSICAL CHEMISTRY OF MAGMAS 147

6.1. Physical properties of magma.	147
6.1.1. Temperature.	147
6.1.2. Gas content of magmas.	149
6.1.3. Viscosity	152
6.1.4. Density	155
6.2. Kinetics of crystallization of magma	156
6.2.1. Introduction.	156
6.2.1.1. Phenomenon of supercooling.	157
6.2.1.2. Nucleation of crystals.	157
6.2.1.3. Growth of crystals.	159
6.2.1.4. Quench crystals.	159
6.2.2. Effect of kinetic factors on igneous rock textures	161
6.2.2.1. Conditions of slow cooling (mainly plutonic rocks)	161
6.2.2.2. Conditions of supercooling (mainly extrusive rocks).	162
6.3. Studies in the equilibrium crystallization of synthetic melts and their bearing on magmatic cooling history, igneous rock compositions and textures	164
6.3.1. Historical review	164
6.3.2. Equilibrium and the phase rule.	166
6.3.3. Melting points of the pure end-members of some common rock-forming mineral species	168
6.3.4. The system diopside—anorthite, a binary system with a eutectic.	168
6.3.4.1. Fractionation	173
6.3.4.2. Melting processes.	173
6.3.5. The plagioclase solid-solution series.	174
6.3.6. The ternary system diopside—anorthite—albite	177
6.3.7. Other simple systems relevant to an understanding of the crystallization of mafic magmas.	180
6.3.7.1. The system nepheline—silica	180
6.3.7.2. The system forsterite—silica.	181
6.3.7.3. The ternary system forsterite—diopside—silica.	183
6.3.7.4. The basalt tetrahedron	185
6.3.7.5. Fractionation trends of olivine and pyroxene	186
6.3.7.6. Overall fractionation trends of mafic magmas	189
6.3.8. Effect of pressure on crystallization temperatures	190
6.3.9. Experimental systems relating to felsic rock melts	192
6.3.9.1. The binary systems Ab—SiO ₂ , Or—SiO ₂ , and Ab—Or	192
6.3.9.2. The ternary system orthoclase—albite—silica.	193
6.3.9.3. The solvus between plagioclase and K-feldspar	195
6.3.9.4. The system NaAlSiO ₄ —KAlSiO ₄ —SiO ₂	198

CHAPTER 7 — DIFFERENTIATION OF IGNEOUS ROCKS 199

7.1. Introduction.	199
7.2. Differentiation processes within liquid magma	201
7.2.1. Diffusion and gaseous transfer processes within liquid magma	201
7.2.2. Liquid immiscibility.	204
7.3. Hybridization	208

7.4. Assimilation	211
* 7.4.1. Principles	211
7.4.2. Limited extent of assimilation by mafic magmas at upper crustal levels	212
7.4.3. Assimilation phenomena involving granitic rocks	214
7.4.3.1. Skarns	215
7.4.3.2. Cognate inclusions	215
7.4.3.3. The Coast Range batholith	216
7.4.3.4. Birrimian granites of Ghana	216
7.4.3.5. Nova Scotia batholith	217
7.4.3.6. Sierra Nevada batholith	218
7.4.3.7. Granites of southwest England	219
7.5. Autometasomatism	220
7.6. Crystal fractionation	223
7.6.1. Flow differentiation	224
7.6.2. Congelation crystallization	225
7.6.3. Gravitational crystal fractionation	229
7.6.3.1. Introduction	229
7.6.3.2. The Skaergaard Intrusion	231
7.6.3.3. Cumulates	234
7.6.3.4. Other tholeiitic layered basic intrusions	238
7.6.3.5. Layered intrusions of compositions other than tholeiite	240
7.6.3.6. Fractionation in sill rocks	240
7.6.3.7. Fractionation in flows	242
7.6.3.8. The behaviour of trace elements during crystal fractionation	243
7.6.3.9. The inferred operation of fractionation in the production of volcanic rock series, using Thingmuli as an example	244
7.6.4. Filter differentiation	247
7.6.5. Autointrusion	248
7.6.6. Fractionation in nuée ardente eruptions	248
CHAPTER 8 — IGNEOUS ROCK SERIES	251
8.1. Historical review	251
8.2. Definition of terms	253
8.3. Tholeiite and alkali basalt	254
8.4. Thermodynamic basis of classification based on silica activity	257
8.5. Basis of classification of igneous rock series followed in this book	259
8.6. Useful parameters, indices and variation diagrams	261
8.7. Complications affecting simple fractionation models	267
CHAPTER 9 — IGNEOUS ROCKS OF OCEANIC AREAS	271
9.1. Oceanic crust	271
9.2. Mid-ocean ridge basalts (MORB)	272
9.3. Oceanic island tholeiites (OIT)	280
9.4. Alkali basalt series and basanites	295
9.5. Highly alkaline rocks of oceanic islands	307
CHAPTER 10 — IGNEOUS ROCKS OF CONTINENTAL AREAS	313
10.1. Introduction	313
10.2. Kimberlites and related rocks	313
10.3. Carbonatites	318
10.4. Highly potassium-rich series	321
10.4.1. Lamproites of Western Australia	321

10.4.2.	Highly alkaline rocks of the western East African rift valley.	324
10.4.3.	Other examples of highly potassium-rich rocks	327
10.5.	Various alkaline series as exemplified by igneous activity in the Kenya dome . .	328
10.6.	Igneous activity in the Afro-Arabian dome associated with plate separation . .	335
10.7.	Continental flood basalts mainly of tholeiitic composition	343
10.7.1.	Columbia River basalts	343
10.7.2.	Keweenaw lavas	345
10.7.3.	Karoo volcanic cycle	347
10.7.4.	Deccan Traps	350
10.7.5.	Tasmanian and Ferrar diabbases	351
10.7.6.	Blosseville Coast basalts of east Greenland	352
10.8.	Intrusive rocks of anorogenic continental terrain	355
10.8.1.	The Oslo region	356
10.8.2.	The Younger Granites of northern Nigeria	358
10.8.3.	The White Mountain plutonic series of New Hampshire	360
10.8.4.	The Tertiary volcanic province of the Inner Hebrides, Scotland	364
10.8.5.	The Gardar province	367
10.9.	Conclusions	367
CHAPTER 11 — IGNEOUS ROCKS ABOVE BENIOFF SEISMIC ZONES.		369
11.1.	Introduction.	369
11.2.	Variation among young SBZ volcanic rocks	370
11.2.1.	The Scotia arc: an island-arc tholeiite series	370
11.2.2.	Fiji — a product of mature island-arc igneous activity comprising rocks of the island-arc tholeiite, calc-alkaline, and shoshonite series. .	375
11.2.3.	Comparison of petrographical and chemical features of rocks belong- ing to the island-arc tholeiite series, calc-alkaline, and shoshonite series	376
11.2.4.	Polarity in areas of SBZ igneous activity	379
11.2.5.	Review of terminology of SBZ igneous rock series	381
11.2.6.	Back-arc spreading.	386
11.2.7.	The North Island of New Zealand — a cautionary tale.	388
11.2.8.	Basin and Range province	397
11.2.9.	Lateral variation in SBZ parental magmas including alkali basalt as shown by rocks of the Lesser Antilles	400
11.2.10.	Volcanism of the central Andes: voluminous andesite and rhyolite with no basic rocks	403
11.3.	Plutonic rocks apparently formed during SBZ eruptive activity	405
11.3.1.	The low-potassium island-arc plutonic complex of Tanzawa.	405
11.3.2.	Ultramafic rocks of Alaskan pipe type.	406
11.3.3.	Coastal Batholith of Peru	408
11.3.4.	Porphyry coppers	410
11.3.5.	Contrasting styles of batholith emplacement and genesis.	412
CHAPTER 12 — IGNEOUS ROCKS OF THE PRECAMBRIAN.		415
12.1.	Introduction.	415
12.2.	Extraterrestrial igneous rocks.	415
12.2.1.	Meteorites	415
12.2.2.	The Moon	417
12.3.	Astroblemes and related igneous activity on the Earth	419
12.4.	Archaean igneous rocks	422
12.4.1.	Introduction.	422
12.4.2.	Oldest crustal rocks	423

12.4.3. Greenstone belts	425
12.4.3.1. The Barberton greenstone belt	426
12.4.3.2. Komatiites from other areas	429
12.4.3.3. The Abitibi greenstone belt	433
12.4.3.4. Structural setting of Archaean igneous activity	434
12.5. Igneous activity in Proterozoic time	434
12.5.1. Introduction.	434
12.5.2. Early mafic intrusives.	436
12.5.3. Proterozoic "orogenic" belts	437
12.5.4. Shear belts, some with associated mafic and ultramafic rocks.	438
12.5.5. Anorthositcs.	439
12.5.6. Distinctive acid eruptive rocks, notably Rapakivi granites	440
12.5.7. Massive mafic eruptions possibly constituting Proterozoic ocean crust	441
12.5.8. Proterozoic belts with possible plate boundary features and associated igneous rocks	442
CHAPTER 13 — PETROGENESIS OF IGNEOUS ROCKS	445
13.1. Introduction.	445
13.2. Composition of upper mantle	446
13.3. Experimental work	449
13.3.1. Starting material for experimental work at high pressures	449
13.3.2. Results of early experimental work.	451
13.4. The mantle—magma system.	453
13.4.1. Temperature regime in the mantle	453
13.4.2. Partial melting in the mantle	455
13.4.3. Upward ascent of magma	456
13.5. Trace elements in mafic rocks	458
13.6. Status of parental magma in petrogenetic work	461
13.7. Conclusions	462
13.7.1. Tholeiites and alkali basalts.	462
13.7.2. Komatiites and high-magnesium basalts	463
13.7.3. Basanites, nephelinites, and melilitites	464
13.7.4. Kimberlites	465
13.7.5. Andesites and associated rocks.	465
13.7.6. Granitic rocks.	470
CHAPTER 14 — DEGRADATION OF IGNEOUS ROCKS	473
14.1. Introduction.	473
14.2. Spilite and keratophyre	474

MINERALOGY OF IGNEOUS ROCKS

1.1. INTRODUCTION

Igneous rocks, apart from those few which are wholly or partly glassy, are composed of minerals and a knowledge of these minerals therefore is one logical starting point for study. Indeed the microscopic determination in thin sections of the content, abundance, and textural relations of component minerals remains, as it was for classical petrographers, the most widely used tool in the investigation of igneous rocks.

A mineral is a naturally-formed chemical compound having a definite chemical composition and crystalline structure reflecting an ordered arrangement of constituent atoms. The words "definite chemical composition" need qualification: a certain amount of crystalline solution (alternatively referred to as solid solution or diadochy) is possibly whereby atoms, essentially of similar sizes, may substitute to a varying extent for each other within certain crystal lattices. This may at first sight appear to the student to be an unwelcome complication. The possibilities, however, for diadochy between major elements are few in number, and the resultant mineral compositions vary in a systematic manner that can reveal a great deal about magma compositions, temperatures of crystallization, fractional crystallization processes and the like (see Chapter 6), and thus prove to be a most useful tool in our understanding of the genesis of igneous rocks. The characteristic crystalline structures of the different minerals (with some degree of variation resulting from this crystalline solution) are reflected in differing optical properties which readily facilitate identification in thin section.

The actual number of distinct mineral species found in any one igneous rock is small, commonly no more than about half a dozen. This in part reflects the small number of chemical elements that are at all abundant in igneous rock compositions, the possibility of substitution between some of these elements within crystal lattices, and the possibility of further substitution such that most remaining elements present in small concentrations in a magma accommodate themselves in the crystal lattices of the common minerals as dispersed elements rather than form distinct mineral species. This observed small number of minerals in any igneous rock also reflects more fundamentally the operation of the phase rule and some close approach to equilibrium conditions of crystallization, thus explaining the systematic way in which magmas of similar compositions have crystallized to give similar proportions of the same small set of minerals.

In addition to this restraint, the range of magma compositions has well-defined limits, and the *total* number of mineral species found in all but rare and compositionally exceptional igneous rocks such as carbonatite is thus also very limited. The olivines, pyroxenes, amphiboles, micas, feldspars, feldspathoids and quartz, plus a few oxide species in fact make up ~99% of the overall content of igneous rocks. The feldspars alone comprise ~50%, and pyroxenes and quartz a further 25%, of igneous rocks in general (although not necessarily, of course, of each individual igneous rock).

1.2. CHEMICAL CONSIDERATIONS

1.2.1. *The chemical elements*

Just as igneous rocks are composed of minerals, so minerals are composed of chemical elements. The periodic table of elements will be familiar to most readers of this book; it is reproduced here (Table 1.1) for reference purposes, and includes the atomic numbers and atomic weights of the first 92 elements including all 90 known to exist naturally on Earth*. The horizontal rows are the seven periods corresponding to the number of electron shells surrounding an atomic nucleus. The major vertical columns contain groups of elements that are related by a similar number and configuration of electrons in an outer shell of up to eight electrons, and hence have comparable chemical properties — properties that commonly show progressive shifts within a group related to the differing atomic weights of its members. Well-recognized groups among the commoner elements include the alkali elements (Li, Na, K, Rb, Cs), the alkaline earth elements (Ca, Sr, Ba), the halogens (F, Cl, Br, I), and the inert or noble gases (He, Ne, Ar, Kr, Xe).

Note that a systematic progression when tabulated in order of increasing atomic number is interrupted in periods 4 to 7 by sets of elements occurring immediately after group IIA. Following the simple Bohr model of the atom, with progressively higher atomic numbers increasing by integral steps, electrons have to be added one by one to the envelope of electron shells to balance the increase in the number of protons in the nucleus. These electrons are added to the outer shell (the one whose electron configuration has a decisive influence on chemical properties) in atoms up to calcium, atomic number 20. After calcium and succeeding group-IIA elements, however, a certain number of electrons are added progressively to inner electron shells,

*Technetium, atomic number 43, has no stable nuclides and does not occur naturally on Earth; its presence in certain stars has, however, been inferred from examination of their spectra indicating that thermonuclear synthesis was proceeding there at or just before the time that their light now reaching us was emitted. Promethium, atomic number 61, similarly has not been detected on Earth.
