INTRODUCTION TO THE MAGNETISM OF THE EARTH IN SPACE

*To my wife Jamie.  
Without her constant encouragement,  
this book would never  
have been completed.*

# Preface

Space science may be defined as the scientific study of cosmic physical systems. It is among the oldest of intellectual pursuits and yet is one of the most challenging endeavors of the modern era.

The use of the word cosmic is intended to emphasize the importance of large-scale, collective phenomena; for example, the properties of collisionless plasmas of cosmic dimensions that have magnetic fields embedded in them cannot be studied in the laboratory because of the difficulty in scaling, yet shocks formed in such plasmas appear to be a very general and important feature of the behavior of matter. They may be responsible for the apparent acceleration of charged particles in the vicinity of the earth and also for the heating of electrons to high temperatures in the neighborhood of the huge discrete radio sources found throughout the known universe.

Space science is an interdisciplinary field; an understanding of many sciences, such as physics, chemistry, and geology, is required in order to understand our total environment. Space science draws on all of these, but the whole is greater than the sum of its parts.

This book is an outgrowth of a one-year course of the same name that my colleagues and I developed in the Department of Space Science at Rice University. The course is open to seniors and to first-year graduate students. A familiarity with college physics, such as the usual first-year course, is assumed, but no previous acquaintance with any of the areas of space science is necessary for the course. Another assumption is that the student is familiar with ordinary differential equations.

The planetary system and the interplanetary medium are discussed in the first 10 chapters. The earth and the near-earth space are used as models whenever possible. Most of the material contained within the first 10 chapters is usually covered during the first semester; the remainder, which emphasizes the sun and the contents of the space beyond the solar system, occupies the second term.

It will be seen that the length of the various chapters is uneven. The fundamental cause is that some areas of space science are better defined and

more knowledge is available than in others. I am most grateful to my colleagues within the Department at Rice, most notably H. R. Anderson, P. A. Cloutier, A. J. Dessler, J. W. Freeman, Jr., D. Heymann, R. P. Kovar, N. Soga, and W. H. Tucker, who have made many valuable contributions to various sections of the book. The responsibility for any errors or for obscurity of presentation, however, is mine alone.

We are not concerned, in space science, with technology. Very little will be found in this volume concerning observatories or vehicles such as balloons, rockets, satellites, or deep-space probes; the emphasis throughout is on the basic principles of the physical phenomena, together with a little speculation concerning future possibilities. We should note, however, that science and technology go hand in hand. One cannot proceed without advances in the other.

Space science may well result in some practical applications. Indeed, it has already resulted in many useful things, ranging from navigation and the calendar to the energy released by nuclear fusion and to improved global communication and weather forecasting.

Applications, however desirable, are not the main goal of science. Space science, like any of the other physical sciences, attempts to increase our understanding of nature and also to describe it as accurately and concisely as possible.

Applications of knowledge to the betterment of man's life cannot result unless there is a body of knowledge to draw upon. Space science represents the attempt by man to extend his knowledge of the physical universe. In my view, it requires no further justification than this for its continued vigorous existence.

Space science has raised more questions than it has answered; this is the excitement of the field. Many problems will undoubtedly remain unsolved for a very long period, but the attempt to resolve them is both fascinating and rewarding. It is the purpose of this book to introduce the reader to our quest for knowledge of the universe, and hopefully this introduction will lead to a sympathetic understanding of that quest.

R. C. HAYMES

# Contents

<b>1.</b>	<b>Celestial Coordinates and Time</b>	<b>1</b>
1.1	The Celestial Sphere	1
1.2	Coordinate Systems	1
1.3	Equatorial Coordinate System	1
1.4	Celestial Poles	2
1.5	Right Ascension	4
1.6	Units of Angular Measurement	4
1.7	Measurement of Latitude	6
1.8	Measurement of Declination	6
1.9	Wandering of the Celestial Poles	7
1.10	Exact Stellar Coordinates	10
1.11	Ecliptic Coordinate System	10
1.12	Galactic Coordinate System	11
1.13	Galactic Equator	11
1.14	Galactic Latitude	15
1.15	Galactic Longitude	15
1.16	Time and Its Measurement	15
1.17	Sidereal and Solar Time	16
1.18	Relationship between Sidereal and Solar Days	17
1.19	Right Ascension and Solar Time	18
1.20	Examples of Time System Conversion	19
1.21	Navigation	19
1.22	Mean Solar Time	20
1.23	The Equation of Time	21
1.24	Civil Time and Time Zones	22
1.25	The Year and the Calendar	22
1.26	Development of the Calendar	22
1.27	Julian Calendar	24
1.28	Gregorian Calendar	24
1.29	Julian Dates	25

<b>2.</b>	<b>Celestial Mechanics</b>	<b>27</b>
2.1	Introduction	27
2.2	Kepler's Laws	27
2.3	Derivation of Kepler's Laws	28
2.4	Motion in a Plane	29
2.5	Kepler's Second Law	29
2.6	Conservation of Energy	30
2.7	Kepler's First Law	31
2.8	Kepler's Third Law	33
2.9	Artificial Earth Satellites	36
2.10	Type of Conic	36
2.11	The Vis-Viva Equation	37
2.12	Some Applications of the Vis-Viva Equation	38
2.13	Applications of Kepler's Laws	39
2.14	Nonsphericity of an Attracting Body	40
2.15	Interplanetary Spacecraft Trajectories	41
2.16	Attraction of a Point Mass by a Body of Finite Dimensions and Arbitrary Mass Distribution	42
2.17	Calculation of the Potential	43
2.18	Perturbations of the Orbit	46
2.19	Numerical Values	47
2.20	The Lagrangian Points	49
<b>3.</b>	<b>The Earth's Atmosphere</b>	<b>54</b>
3.1	Introduction	54
3.2	Nomenclature and Temperature Profile	54
3.3	Temperature Distribution in the Troposphere	57
3.4	Temperature of the Stratosphere	60
3.5	Temperatures of the Mesosphere and Thermosphere	61
3.6	Temperature Variability	62
3.7	The Pressure Profile	63
3.8	Scale Height	64
3.9	Density Variation	65
3.10	Present Atmospheric Composition and Its Evolution	65
3.11	Thickness of the Atmosphere	69
3.12	The Ionosphere	69
3.13	Effect on Scale Height	70
3.14	Ionospheric Electric Fields	71
3.15	Ionization Profile	72

3.16	Layer of Charge	75
3.17	Ionospheric Hydrogen and Helium	78
3.18	Ionosondes	78
3.19	Conductivity of the Ionosphere	82
<b>4.</b>	<b>The Other Planets and Their Atmospheres</b>	<b>90</b>
4.1	Planetary Distances and the Astronomical Unit	90
4.2	The Solar Constant	93
4.3	Radiation	95
4.4	Planetary Temperatures	95
4.5	The Subsolar Temperature	97
4.6	The Greenhouse Effect	97
4.7	Molecular Spectra and Planetary Temperatures	98
4.8	Mercury	99
4.9	Venus	101
4.10	Mars	106
4.11	The Asteroids	114
4.12	Jupiter	115
4.13	Saturn	120
4.14	Uranus	122
4.15	Neptune	122
4.16	Pluto	123
<b>5.</b>	<b>Airglow</b>	<b>128</b>
5.1	Airglow Observations	128
5.2	The Planetary Origin of the Radiation	128
5.3	The Height of the Emitting Region	129
5.4	Emission and Absorption of Radiation	134
5.5	Calculation of Transition Probabilities	140
5.6	Forbidden Transitions and Collisional De-excitation	140
5.7	Radiative Transfer	143
5.8	Other Means of Altitude Determination	144
5.9	Dayglow	145
5.10	Causes of Airglow	147
<b>6.</b>	<b>The Aurora</b>	<b>150</b>
6.1	Auroral Research	150
6.2	Geographical Distribution and Morphology	152

6.3	Time Variations in Aurorae	157
6.4	Auroral Brightness	158
6.5	Auroral Spectra	158
6.6	Particle Bombardment	160
6.7	Particle Trajectories	161
6.8	Related Phenomena	162
6.9	Auroral Particle Configurations	163
<b>7.</b>	<b>Van Allen Radiation</b>	<b>166</b>
7.1	General Discussion	166
7.2	Motion of Charged Particles in Magnetic Fields	167
7.3	Motion in a Dipole Field	170
7.4	Motion in the Real Geomagnetic Field	170
7.5	The Three Characteristic Times of the Motion	172
7.6	The Maximum Trapped Flux	173
7.7	Conservation of Unidirectional Flux	174
7.8	The <i>B-L</i> Coordinate System	175
7.9	Observed Distribution of Radiation	176
7.10	Composition of the Trapped Radiation	179
7.11	Trapped Protons	179
7.12	Trapped Electrons	181
7.13	Artificial Electrons	182
7.14	Radiation in the Distant Magnetosphere	183
7.15	Local Acceleration Mechanisms	184
7.16	Magnetospheric Plasma	185
7.17	High-Energy Radiation in the Distant Magneto- sphere	185
7.18	Lifetimes of Trapped Particles	188
7.19	Loss Mechanisms for Trapped Radiation	189
7.20	Sources of the Van Allen Radiation	190
<b>8.</b>	<b>Planetary Interiors</b>	<b>195</b>
8.1	The Earth's Surface	195
8.2	Seismology	197
8.3	Density Variation	199
8.4	Model Interiors	202
8.5	Temperature Profile	204
8.6	Future Experiments	205

8.7	The Moon	207
8.8	The Other Planets	210

**9. Planetary Magnetism      214**

9.1	The Geomagnetic Coordinate System	214
9.2	The Dip Poles	217
9.3	Local Coordinates	217
9.4	Dipolar Relations	218
9.5	The Dip Latitude	220
9.6	Mathematical Descriptions of the Field	221
9.7	The Secular Variation	224
9.8	Origin of the Main Field	225
9.9	Disturbance Indicators	226
9.10	Geomagnetic Storms	228
9.11	The Magnetosphere and the Solar Wind	230
9.12	Rapid Fluctuations	237
9.13	Daily Variations	239

**10. Comets, Meteors, and the Interplanetary Medium      243**

10.1	Introduction to Comets	243
10.2	Designations	243
10.3	Cometary Statistics	246
10.4	Physical Characteristics	246
10.5	The Nucleus	247
10.6	The Coma	248
10.7	The Tail	249
10.8	Cometary Lifetimes	251
10.9	The Origins of Comets	251
10.10	Origin of Meteors	252
10.11	Meteoritics	252
10.12	Meteor Masses	252
10.13	Meteor Influx	254
10.14	Meteor Trajectories	254
10.15	Chemical Composition	260
10.16	Cosmic Ray Bombardment	260
10.17	Meteoritic Ages	262
10.18	Origins	264
10.19	Particle Loss Mechanisms	266

10.20	The Zodiacal Light	269
10.21	The Gegenschein	274
10.22	The Solar Wind	275
10.23	Supersonic Flow	277
10.24	Supersonic Wind	278
10.25	Interplanetary Magnetic Fields	280
10.26	Spiral Structure	282
10.27	Interplanetary Configuration	285
10.28	Termination of the Interplanetary Field	287
<b>11.</b>	<b>Introduction to Stellar Structure</b>	<b>291</b>
11.1	The Sun	291
11.2	Sunspots and the Solar Cycle	293
11.3	Spot Characteristics	293
11.4	Solar Flares	295
11.5	Solar Magnetic Fields	299
11.6	Stellar Energy Sources	308
