FLUID DYNAMICS
ADVANCED HYDRO-DYNAMICS

नमामीशमीशान निर्वाण रूपं । विभुं व्यापकं ब्रह्मं वेदस्वरूपं ॥
निजं निर्गुणं निर्विकल्पं निरीहं । विदाकाशमाकाशवासं भजेऽहं ॥

We adore you, the guardian of the south-east quarter and Ruler of the whole universe, eternal bliss personified, the omnipresent and all pervading Brahma, manifest in the form of Vedas. We worship Lord Shiva shining in his own glory, devoid of material attributes, undifferentiated, desireless, all pervading consciousness, having nothing to wrap about Himself except ether.

—Authors and Publishers

PREFACE

This book on Fluid Dynamics has been written to cater to the requirements of students studying Fluid Dynamics, Hydro Dynamics or Hydro Mechanics at Post-graduate and Honours standard of all Indian Universities. A large number of articles and problems have been done with the help of Vector Algebra and Vector Calculus. Problems have been selected from standard text books and examination papers of various universities. Students and teachers will find that the subject has been dealt in a lucid and clear style. Enough care has been taken to prevent mistakes and printing errors creeping in, but it is not possible to claim complete immunization. It shall be our pleasure to gratefully acknowledge any suggestions or pointing of errors from teachers and students of the subject.

We are grateful to Shri K. K. Mittal Proprietor M/s Pragati Prakashan and Shri J. P. Rastogi Proprietor Naveen Press, Meerut for the pains they have taken in bringing out the book.

	Exercises	112-114
3	Sources, Sinks & Doublets	115-174
	(Motion in two dimensions)	
	Lagrangian stream function	115
	Irrotational motion in two dimensions	117
	Complex potential	118

<i>Chapter</i>	<i>Page</i>
Definition of source, sink	119
Complex potential due to a source	120
Complex potential due to a doublet	121
Images w. r. t. straight line	122
Images w. r. t. circle	123
Circle theorem of Milne-Thomson	126
Blasius Theorem	128
Solved problems	130-171
Exercises	171-174
4 Motion of Cylinders	
Part 1—Circular cylinders	175-207
Boundary conditions for stream function	175
General motion of any cylinder	175
Motion of a circular cylinder	177
Applications of circle theorem	179
Initial motion between two co-axial cylinders	180
Kinetic energy of liquid	181
Streaming and circulation about a fixed circular cylinder	184
Equation of motion of circular cylinder with circulation	187
Solved problems	188-204
Exercises	204-207
Part 2—Elliptic cylinders	208-233
Elliptic co-ordinates	208
Solutions of Laplace's equation, Joukowski transformation	209
Streaming past a fixed elliptic cylinder	209
ψ for the motion of elliptic cylinder in liquid	211
ψ for the motion of liquid in presence of fixed elliptic cylinder	212
K. E. for rotating elliptic cylinder	213
K. E. of liquid contained in a rotating cylinder	214
Circulation about an elliptic cylinder	216
Solved problems	218-231
Exercises	231-233
5 Motion of a Sphere	234-269
(Motion in three Dimensions)	
Equation of continuity	234

Liquid streaming past a fixed sphere	236
Equation of a sphere	237
Problem of initial motion	240
Solved problems	242-266
Exercises	266-269
6 Stoke's Stream Function	270-294
Stoke's function	270
Property of Stoke's function, Irrotational motion	271
Solution for ψ	273
Motion of a solid of revolution along the axis	274
ϕ and ψ due to three dimensional source	276
ψ due to a line source	276
Image of source relative to sphere	277
Image of doublet relative to sphere	279
Solved problems	280-293
Motion of liquid inside a rotating ellipsoidal sphere	287
Exercises	293-294
7 General Theory of Irrotational Motion	295-317
Some elementary definitions	295
Irrotational motion	296
Kinetic energy of finite liquid	298
Kinetic energy of infinite liquid	298
Kelvin's minimum energy theorem	300
Mean value of ϕ	300
Green's theorem	302
Solved problems	303-315
Permanence of irrotational motion	305
Exercises	315-317
8 Vortex Motion	318-390
Some elementary definitions	318
Properties of vortex filaments	319
Complex potential due to a vortex of strength $+k$	320
Motion due to n vortices	321
Single vortex in the field of several vortices	322
Two vortex filaments	324
Image of vortex w.r.t. a plane	326

<i>Chapter</i>	<i>Page</i>
Image of vortex w.r.t. a cylinder	327
Complex potential due to vortex doublet, Spiral vortex	328
Rankine combined vortex	332
Rectilinear vortex with elliptic cross section	333
Solved problems	336-369
Routh's theorem	362
Motion of any vortex	365
Solved Problems	370-387
Vortex sheet	370
Infinite single row of vortices of equal strength	371
Two infinite rows of vortices	372
Karman's vortex sheet	374
Vortex between parallel walls	387-390
Exercises	
9 Conformal Representation	319-421
Conformal transformation	391
Analysis of Joukowski's transformation	392
Kutta-Joukowski's theorem	394
Flow round a circle	396
Schwarz-Christoffel transformation	399
Transformation of semi-infinite strip	402
Transformation of infinite strip	403
A fundamental theorem	404
Solved problems	405-417
Flow past a step in a deep stream	418
Exercises	420-421
10 Discontinuous Motion	422-435
Free stream line. Discontinuous motion	422
Flow of a liquid through an aperture	423
Borda's mouth piece	425
Direct impact of a stream lamina	431
Exercises	434-435
11 Liquid Waves	436-493
Introduction. Wave motion	436
Some elementary definitions	437
Stationary waves. Kinds of wave motion	439
Wave propagation in a canal of uniform depth	441

<i>Chapter</i>	<i>Pages</i>
Progressive wave on deep water	445
Stationary waves of the surface of a canal of finite depth h	447
Kinetic energy and potential energy	451
Energy of stationary wave	453
Steady motion of progressive waves	454
Waves at the common surface of two liquids	456
Waves at the common surface of two liquids with upper surface free	459
Solved problems	463-475
Cisotti's equation for long waves	476
Motion of a surface particle	478
Long waves at the common surface of two liquids	479
Group velocity. Transmission of energy	480
Surface tension and Capillary waves	484
Capillary waves at the common surface of two liquids	487
Solved problems	488-490
Exercises	490-493
12 Viscosity	494-542
Definition	494
Most general motion of a fluid element	497
Strain tensor	498
Strain Analysis	499
Stress Analysis	499
Principal stresses and Stoke's relation	501
Navier-Stoke's equation	503
Dissipation of energy	508
Circulation in a viscous fluid	509
Reynold's number	510
Steady flow between parallel planes	511
Laminar flow between parallel plates	513
Solved numerical problems	516
Theory of Lubrication	518
Steady flow through a cylindrical pipe	521
Steady flow between co-axial circular cylinders	524
Steady flow due to slowly rotating sphere	526
Diffusion of a vortex filament	529
Solved problems	

<i>Chapter</i>	<i>Pages</i>

13 Boundary Layer Flow	543-558
Drag and lift	543
Prandtl's boundary layer theory	544
Boundary layer equations	544
Karman's integral equation	546
Karman's momentum integral equation	549
Flow parallel to a semi infinite flat plate	549
Karman-Pohlhausen's method	551
Karman's momentum theorem and boundary layer along a flat plate	555
Prandtl number	557
Exercises	557-558

SOME PRELIMINARIES, IMPORTANT FORMULAE

Group A—Results of Vector Analysis

Vectors. Bold face type is used to denote vector and italic letter to denote the magnitude of the vector. For example a is the magnitude of the vector \mathbf{a} .

(1) If \mathbf{r} be the position vector of a current point $P(x, y, z)$, then $\mathbf{r} = x\mathbf{i} + y\mathbf{j} + z\mathbf{k}$, where $\mathbf{i}, \mathbf{j}, \mathbf{k}$ are unit vectors along x, y, z axes respectively.

(2) A vector of magnitude one is called **unit vector**.

(3) Let $\mathbf{a} = a_1\mathbf{i} + a_2\mathbf{j} + a_3\mathbf{k}$, $\mathbf{b} = b_1\mathbf{i} + b_2\mathbf{j} + b_3\mathbf{k}$. Then
 $a^2 = a_1^2 + a_2^2 + a_3^2$, $b^2 = b_1^2 + b_2^2 + b_3^2$,
 $\mathbf{a} \cdot \mathbf{b} = a_1b_1 + a_2b_2 + a_3b_3$,

$$\mathbf{a} \times \mathbf{b} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix}. \quad \text{Also } \mathbf{a} \times \mathbf{b} = \hat{\mathbf{n}} ab \sin \theta, \\ \mathbf{a} \cdot \mathbf{b} = ab \cos \theta$$

where θ is the angle between \mathbf{a} and \mathbf{b} ; and $\hat{\mathbf{n}}$ is a unit vector perpendicular to the plane containing \mathbf{a} and \mathbf{b} .

$$(4) \nabla = \mathbf{i} \frac{\partial}{\partial x} + \mathbf{j} \frac{\partial}{\partial y} + \mathbf{k} \frac{\partial}{\partial z}, \quad \text{grad } \phi = \nabla \phi$$

$$\text{div } \mathbf{a} = \nabla \cdot \mathbf{a} = \frac{\partial a_1}{\partial x} + \frac{\partial a_2}{\partial y} + \frac{\partial a_3}{\partial z}$$

$$\text{curl } \mathbf{a} = \nabla \times \mathbf{a} = \begin{vmatrix} \mathbf{i} & \mathbf{j} & \mathbf{k} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ a_1 & a_2 & a_3 \end{vmatrix}$$

$$\text{curl } (\phi \mathbf{a}) = \phi \text{ curl } \mathbf{a} + (\text{grad } \phi) \times \mathbf{a}$$

$$\text{div } (\phi \mathbf{a}) = \phi \text{ div } \mathbf{a} + (\text{grad } \phi) \cdot \mathbf{a}$$

$$\text{div } (\mathbf{a} \times \mathbf{b}) = \mathbf{b} \cdot \text{curl } \mathbf{a} - \mathbf{a} \cdot \text{curl } \mathbf{b}$$

$$\text{curl } (\mathbf{a} \times \mathbf{b}) = \mathbf{a} \text{ div } \mathbf{b} - \mathbf{b} \text{ div } \mathbf{a} + (\mathbf{b} \cdot \nabla) \mathbf{a} - (\mathbf{a} \cdot \nabla) \mathbf{b}$$

$$\text{grad } (\mathbf{a} \cdot \mathbf{b}) = \mathbf{a} \times \text{curl } \mathbf{b} + \mathbf{b} \times \text{curl } \mathbf{a} + (\mathbf{a} \cdot \nabla) \mathbf{b} + (\mathbf{b} \cdot \nabla) \mathbf{a}$$

$$\text{curl curl } \mathbf{a} = \text{grad div } \mathbf{a} - \nabla^2 \mathbf{a}$$

$$\mathbf{a} \cdot \nabla = a_1 \frac{\partial}{\partial x} + a_2 \frac{\partial}{\partial y} + a_3 \frac{\partial}{\partial z}$$

$$\text{div curl } \mathbf{a} = 0, \text{ curl grad } \phi = 0 \text{ for every } \mathbf{a} \text{ and } \phi.$$

(*) Let \mathbf{n} be a unit outward normal vector. Then

$$\text{Gauss Theorem} \quad \int_S \mathbf{n} \cdot \mathbf{F} dS = \int_V \nabla \cdot \mathbf{F} dV$$

and

$$\int_S \mathbf{n} p dS = \int_V \nabla p dV.$$

$$\text{Stoke's Theorem} \quad \int_C \mathbf{F} \cdot d\mathbf{r} = \int_S \text{curl } \mathbf{F} \cdot \mathbf{n} dS.$$

(6) The vector ∇f is normal at every point of the surface $f = \text{const.}$

Group B—Results of Trigonometry

$$\log (a+ib) = \frac{1}{2} \log (a^2+b^2) + i \tan^{-1} \left(\frac{b}{a} \right)$$

$$\log (a-ib) = \frac{1}{2} \log (a^2+b^2) - i \tan^{-1} \left(\frac{b}{a} \right)$$

$$\tan^{-1} a - \tan^{-1} b = \tan^{-1} \left(\frac{a-b}{1+ab} \right)$$

$$\tan^{-1} a + \tan^{-1} b = \tan^{-1} \left(\frac{a+b}{1-ab} \right).$$

Group C—Results of Differential Calculus

If ψ is the angle made by a tangent with x -axis, then

$$\tan \psi = \frac{dy}{dx}, \cos \psi = \frac{dx}{ds}, \sin \psi = \frac{dy}{ds}.$$

Two lines will be perpendicular if $m_1 m_2 = -1$.

$\Gamma(n+1) = n!$ if n is a positive integer.

$$\Gamma(1) = 1, \Gamma\left(\frac{1}{2}\right) = \sqrt{\pi}, \Gamma(n) \Gamma(1-n) = \pi / \sin n\pi,$$

$$\Gamma\left(n + \frac{1}{2}\right) = \frac{\sqrt{\pi} \cdot \Gamma(2n)}{2^{2n-1}}.$$

Group D—Results of Complex Variable

1. The necessary and sufficient condition for a function $f(z) = u + iv$ to be analytic is that (i) u_x, u_y, v_x, v_y all are continuous and (ii) $u_x = v_y, u_y = -v_x$ where $u_x = \partial u / \partial x$. (These equations are called Cauchy-Riemann equations.)

2. Cauchy Residue Theorem :—

$$\int_C f(z) dz = 2\pi i (\text{Sum of residues within } C).$$

3. Residue at simple pole $z=a$ is the coefficient of $1/(z-a)$ in the expansion of $f(z)$.

Some Important formulae occurring in this book

Chapter 1. Equations of Continuity

1. $\mathbf{q} = -\nabla\phi$ where ϕ is velocity potential.

$$2. \frac{d}{dt} = \frac{\partial}{\partial t} + \mathbf{q} \cdot \nabla = \frac{\partial}{\partial t} + u \frac{\partial}{\partial x} + v \frac{\partial}{\partial y} + w \frac{\partial}{\partial z}$$

where $\mathbf{q} = u\mathbf{i} + v\mathbf{j} + w\mathbf{k}$.

Flux = Density. Area of the surface. Normal velocity

$$\frac{d\rho}{dt} + \rho \nabla \cdot \mathbf{q} = 0 : \text{Euler's equation of continuity}$$

$\rho J = \rho_0$: Lagrange's equation of continuity.

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = 0 \text{ is the equation of continuity for liquid.}$$

$$\left(u \frac{\partial}{\partial x} + v \frac{\partial}{\partial y} + w \frac{\partial}{\partial z} + \frac{\partial}{\partial t} \right) F = 0 \text{ is the condition for the surface}$$

$F(x, y, z, t) = 0$ to be a possible form of boundary surface.

$$\frac{dx}{u} = \frac{dy}{v} = \frac{dz}{w} : \text{differential equations of stream lines.}$$

$\mathbf{W} = \frac{1}{2} \text{curl } \mathbf{q} = 0$ if motion is irrotational.

$$ds^2 = (dr)^2 + (r d\theta)^2 + (r \sin \theta d\omega)^2 : \text{spherical line element}$$

$$ds^2 = (dr)^2 + (r d\theta)^2 + (dz)^2 : \text{cylindrical line element.}$$

Spherical polar co-ordinates : $x = r \sin \theta \cos \omega$,

$y = r \sin \theta \sin \omega$, $z = r \cos \theta$.

$$u = -\frac{\partial \phi}{\partial x} = -\frac{\partial \phi}{\partial r}, \quad v = -\frac{\partial \phi}{\partial y} = -\frac{1}{r} \frac{\partial \phi}{\partial \theta}, \quad w = -\frac{\partial \phi}{\partial z} = -\frac{1}{r \sin \theta} \frac{\partial \phi}{\partial \omega}.$$

Equation of continuity in orthogonal curvilinear co ordinates

$$\text{is } \frac{\partial}{\partial t} (\rho h_1 da_1 \cdot h_2 da_2 \cdot h_3 da_3).$$

$$\begin{aligned} &= - \left[h_1 da_1 \cdot \frac{\partial}{h_1 \partial a_1} (\rho q_1 \cdot h_2 da_2 \cdot h_3 da_3) \right. \\ &\quad \left. + h_2 da_2 \cdot \frac{\partial}{h_2 \partial a_2} (\rho q_2 \cdot h_1 da_1 \cdot h_3 da_3) \right. \\ &\quad \left. + h_3 da_3 \cdot \frac{\partial}{h_3 \partial a_3} (\rho q_3 \cdot h_1 da_1 \cdot h_2 da_2) \right]. \end{aligned}$$

Chapter 2. Equations of Motion

(1) Equation of continuity in different forms :--

$$\frac{\partial u}{\partial x} + \frac{\partial v}{\partial y} + \frac{\partial w}{\partial z} = 0 \text{ for liquid}$$

$xv = F(t)$ when motion has spherical symmetry

$xv = F(t)$ when motion has cylindrical symmetry

$$\frac{\partial \rho}{\partial t} + \frac{\partial (\rho v)}{\partial x} = 0 \text{ when velocity has one component.}$$

$$(2) \quad \frac{d\mathbf{q}}{dt} = \mathbf{F} - \frac{1}{\rho} \nabla p : \text{ Euler's equation of motion.}$$

$\mathbf{F} = -\nabla \Omega$. Also $\frac{\partial v}{\partial t} + v \frac{\partial v}{\partial x} = F - \frac{1}{\rho} \frac{\partial p}{\partial x}$: equation of motion when velocity has one component.

Equation of motion for symmetrical motion :

$$\frac{\partial v}{\partial t} + v \frac{\partial v}{\partial r} = F - \frac{1}{\rho} \frac{\partial p}{\partial r}.$$

Bernoulli's pressure equations :

$$\int \frac{dp}{\rho} + \frac{1}{2} q^2 + \Omega = C \text{ more steady motion}$$

and
$$\int \frac{dp}{\rho} - \frac{\partial \phi}{\partial t} + \frac{1}{2} q^2 + \Omega = C \text{ more for unsteady motion.}$$

Equations for impulsive action : $\mathbf{q}_2 - \mathbf{q}_1 = \mathbf{I} - \frac{1}{\rho} \nabla \omega.$

Helmholtz vorticity equation : $\frac{d}{dt} \left(\frac{\mathbf{W}}{\rho} \right) = \left(\frac{\mathbf{W}}{\rho} \cdot \nabla \right) \mathbf{q}.$

Chapter 3. Sources, Sinks and Doublets

Lagrange's function ψ :

$$-\frac{\partial \phi}{\partial x} = u = -\frac{\partial \psi}{\partial y}, \quad -\frac{\partial \phi}{\partial y} = v = \frac{\partial \psi}{\partial x}.$$

Complex potential : $W = \phi + i\psi, \quad -\frac{dW}{dz} = u - iv$

$$\frac{\partial \phi}{\partial r} = \frac{1}{r} \cdot \frac{\partial \psi}{\partial \theta}, \quad \frac{1}{r} \cdot \frac{\partial \phi}{\partial \theta} = -\frac{\partial \psi}{\partial r}.$$

Complex potential due to source $+m$ at $z=a$ is
 $W = -m \log(z-a)$, in this case $\phi = -m \log r$, $\psi = -m\theta$.

Complex potential due to doublet μ at $z=a$, angle α is

$$W = \frac{\mu e^{i\alpha}}{z-a}.$$

- (i) Image of a source $+m$ w.r.t. a line is a source $+m$ at an equal distance on the other side of the line.
- (ii) Image of a doublet μ relative to a line is a doublet μ

at an equal distance on the other side of the line and its axis is antiparallel to the object doublet.

- (iii) Image of a source $+m$ w.r.t. circle is a source $+m$ at the inverse point and sink $-m$ at the centre.
- (iv) Image of a doublet of strength μ with its axis inclined at an angle α w.r.t. circle is a doublet of strength $\mu' = \mu a^2/f^2$ with its axis inclined at an angle $\pi - \alpha$ where a is the radius of circle and f is the distance of doublet from the centre.

Blasius Theorem : $X - iY = \frac{i\rho}{2} \int_c \left(\frac{dW}{dz} \right)^2 dz.$

Chapter 4. Motion of Cylinders. Part I—Circular cylinders

$$\begin{aligned} \text{K. E. of liquid} &= -\frac{1}{2} \rho \int \phi \frac{\partial \phi}{\partial n} ds \text{ on } r=a \\ &= -\frac{1}{2} \rho \int_0^{2\pi} \left(\phi \frac{\partial \phi}{\partial r} \right)_{r=a} \cdot a d\theta. \end{aligned}$$

General motion of cylinder

$$\psi = vx - uy + \frac{\omega}{2} (x^2 + y^2) + c$$

- (i) When circular cylinder is in motion with velocity U along x axis, then $W = Ua^2/z$.
- (ii) Streaming past a fixed cylinder : $W = Uz + (Ua^2/z)$.

$$W = \frac{ik}{2\pi} \log z \text{ due to circulation of strength } k \text{ only.}$$

Part 2—Elliptic cylinders

Elliptic co-ordinates :

$$\begin{aligned} z &= c \cosh \zeta = c \cosh (\xi + i\eta), \quad c^2 = a^2 - b^2, \\ a &= c \cosh \alpha, \quad b = c \sinh \alpha, \quad a + b = c e^\alpha. \end{aligned}$$

$$T = \text{K. E. of liquid} = -\frac{1}{2} \int \left(\phi d\psi \right)_{\xi=\alpha}.$$

$$\text{Solution of } \nabla^2 \psi \text{ is } \psi = e^{-n\xi} (A \cos n\eta + B \sin n\eta), \quad \frac{\partial \phi}{\partial \xi} = \frac{\partial \psi}{\partial \eta}.$$

If an elliptic cylinder is rotating in a liquid, then

$$\phi = \frac{\omega}{4} (a+b)^2 e^{-2\xi} \sin 2\eta, \quad \psi = \frac{\omega}{4} (a+b)^2 e^{-2\xi} \cos 2\eta,$$

$$T = \text{K. E. of liquid} = \frac{\pi}{16} \rho \omega^2 c^4.$$

K. E. of liquid contained in a rotating elliptic cylinder is
