Dedicated to the Memory of

Lucien Le Cam (1924-2000) and John W. Tukey (1915-2000)

Preface to the Third Edition

The Third Edition of *Testing Statistical Hypotheses* brings it into consonance with the Second Edition of its companion volume on point estimation (Lehmann and Casella, 1998) to which we shall refer as *TPE*2. We won't here comment on the long history of the book which is recounted in Lehmann (1997) but shall use this Preface to indicate the principal changes from the 2nd Edition.

The present volume is divided into two parts. Part I (Chapters 1–10) treats small-sample theory, while Part II (Chapters 11–15) treats large-sample theory. The preface to the 2nd Edition stated that "the most important omission is an adequate treatment of optimality paralleling that given for estimation in *TPE*." We shall here remedy this failure by treating the difficult topic of asymptotic optimality (in Chapter 13) together with the large-sample tools needed for this purpose (in Chapters 11 and 12). Having developed these tools, we use them in Chapter 14 to give a much fuller treatment of tests of goodness of fit than was possible in the 2nd Edition, and in Chapter 15 to provide an introduction to the bootstrap and related techniques. Various large-sample considerations that in the Second Edition were discussed in earlier chapters now have been moved to Chapter 11.

Another major addition is a more comprehensive treatment of multiple testing including some recent optimality results. This topic is now presented in Chapter 9. In order to make room for these extensive additions, we had to eliminate some material found in the Second Edition, primarily the coverage of the multivariate linear hypothesis.

Except for some of the basic results from Part I, a detailed knowledge of small-sample theory is not required for Part II. In particular, the necessary background should include: Chapter 3, Sections 3.1–3.5, 3.8–3.9; Chapter 4: Sections 4.1–4.4; Chapter 5, Sections 5.1–5.3; Chapter 6, Sections 6.1–6.2; Chapter 7, Sections 7.1–7.2; Chapter 8, Sections 8.1–8.2, 8.4–8.5.

Of the two principal additions to the Third Edition, multiple comparisons and asymptotic optimality, each has a godfather. The development of multiple comparisons owes much to the 1953 volume on the subject by John Tukey, a mimeographed version which was widely distributed at the time. It was officially published only in 1994 as Volume VIII in *The Collected Works of John W. Tukey*.

Many of the basic ideas on asymptotic optimality are due to the work of Le Cam between 1955 and 1980. It culminated in his 1986 book, *Asymptotic Methods in Statistical Decision Theory*.

The work of these two authors, both of whom died in 2000, spans the achievements of statistics in the second half of the 20th century, from model-free data analysis to the most abstract and mathematical asymptotic theory. In acknowledgment of their great accomplishments, this volume is dedicated to their memory.

Special thanks to George Chang, Noureddine El Karoui, Matt Finkelman, Brit Katzen, Mee Young Park, Elizabeth Purdom, Armin Schwartzman, Azeem Shaikh and the many students at Stanford University who proofread several versions of the new chapters and worked through many of the over 300 new problems. The support and suggestions of our colleagues is greatly appreciated, especially Persi Diaconis, Brad Efron, Susan Holmes, Balasubramanian Narasimhan, Dimitris Politis, Julie Shaffer, Guenther Walther and Michael Wolf. Finally, heartfelt thanks go to friends and family who provided continual encouragement, especially Joe Chavez, Ann Marie and Mark Hodges, David Fogle, Scott Madover, Tom Neville, David Olachea, Janis and Jon Squire, Lucy, and Ron Susek.

THEORY OF POINT ESTIMATION

Second Edition

E.L. LEHMANN and GEORGE CASELLA

This second, much enlarged edition by Lehmann and Casella of Lehmann's classic text on point estimation maintains the outlook and general style of the first edition. All of the topics are updated. An entirely new chapter on Bayesian and hierarchical Bayesian approaches is provided, and there is much new material on simultaneous estimation. Each chapter concludes with a Notes section, which contains suggestions for further study. The book is a companion volume to the second edition of Lehmann's *Testing Statistical Hypotheses*.

1998/589 PP./HARDCOVER/ISBN 0-387-98502-6 SPRINGER TEXTS IN STATISTICS

ELEMENTS OF LARGE-SAMPLE THEORY

E.L. LEHMANN

Elements of Large Sample Theory provides a unified treatment of first-order large-sample theory. It discusses a broad range of applications including introductions to density estimation, the bootstrap, and the asymptotics of survey methodology written at an elementary level. The book is suitable for students at the Master's level in statistics and in applied fields who have a background of two years of calculus.

From a review:

"The book also contains rich collection of problems and a useful list of references, and can be warmly recommended as a complementary text to lectures on mathematical statistics, as well as a textbook for more advanced courses."

— EUROPEAN MATHEMATICAL SOCIETY

1999/631 PAGES/HARDCOVER/ISBN 0-387-98595-6 SPRINGER TEXTS IN STATISTICS

SUBSAMPLING

DIMITRIS N. POLITIS, JOSEPH P. ROMANO and MICHAEL WOLF

Since Efron's profound paper on the bootstrap, an enormous amount of effort has been spent on the development of bootstrap, jackknife, and other resampling methods. The primary goal of these computer-intensive methods has been to provide statistical tools that work in complex situations without imposing unrealistic or unverifiable assumptions about the data generating mechanism. This book sets out to lay some of the foundations for subsampling methodology and related methods.

From a review:

"The book is one of the most comprehensive texts in the subsampling realm and provides a solid background for researchers working in the related areas of statistics."
