#### **PREFACE**

THE THEORY of extreme values is mentioned in most of the recent textbooks of statistics. However, this seems to be the first book devoted exclusively to these problems. It is meant for statisticians, and statistically minded scientists and engineers. To spread the application of the methods, the author has tried to keep it on an elementary level. Graphical procedures are preferred to tedious calculations. Special cases and easy generalizations are given as exercises. Therefore, the book may even meet the requirements of a textbook.

Since the line of thought pursued here is new, the reader should not expect complete solutions. There are bound to be shortcomings and gaps in a first treatment. Despite the usual prescriptions of academic habits, unsolved problems are here clearly stated. Perhaps a carping critic might maintain that more problems are raised than solved. However, this is the common fate of science.

This book is written in the hope, contrary to expectation, that humanity may profit by even a small contribution to the progress of science.

The opportunity to start this book presented itself when the necessary free time was imposed upon the author. A first draft of the manuscript was written in 1949 under a grant by the Lucius N. Littauer Foundation. This draft was revised in 1950 under a grant from the John Simon Guggenheim Memorial Foundation. The work continued while the author was engaged as a Consultant at Stanford University and later as an Adjunct Professor at Columbia University, partially under a grant from the Higgins Foundation, and under contract with the Office of Ordnance Research. Finally, a further grant from the Guggenheim Foundation made it possible to engage Professor Frank Lee (Columbia University) for the drawing of the graphs. The author wishes to state his sincere appreciation to these agencies for their help, without which he would not have had the chance to finish this book.

He is indebted to Mr. E. N. Munns, formerly Chief, Division of Forest Influence, U. S. Department of Agriculture, for valuable office help. Dr. Wolfgang Wasow of the University of California (Los Angeles) suggested changes in Chapters 1 and 3 and contributed to section 8.1. P. G. Carlson (Arthur Anderson and Co.) gave the proof for 3.2.3(7). The idea underlying 6.1.6 is due to Dr Julius Lieblein of the D. Taylor Model Basin. Paragraphs 6.2.4, 6.2.5, and 6.2.7 have been written by B. F. Kimball (N. Y.

State Public Service Commission). Most of the work in section 8.2 was done in collaboration with the late Roger D. Keeney. The Watson Scientific Computing Laboratory (Columbia University) calculated the figures given in Table 6.2.3 and put at the author's disposal an unpublished table of the probability points and the first two differences for  $\Phi = .00001$  (.00001) .00600 (.00010) .08000 (.00100) .84000 (.00010) .98400 (.00001) .99995. These data facilitated much numerical work. Table 7.2.3 was calculated by Gladys R. Garabedian of Stanford University. The author takes this occasion to express his thanks for these important contributions.

Mr. Arnold Court (University of California, Berkeley) suggested applications to climatology, and Professor S. B. Littauer (Dept. of Industrial Engineering, Columbia University) proposed valuable improvements.

The author profited greatly from his collaboration with Professor A. M. Freudenthal (Columbia University) in their common work on fatigue of metals (see 7.3.5), and from the continuous interest which the Statistical Engineering Laboratory of the National Bureau of Standards took in his work.

The whole manuscript was revised and corrected by Mr. L. H. Herbach (New York University), P. G. Carlson, C. Derman (Columbia University), and A. Court. The bibliography was checked by M. Taro Yamane (New York University). It gives the author great p.easure to thank these collaborators, and in particular Mr. Carlson, for their friendly assistance. They certainly have contributed whatever may be good in this book. The rest should be charged against the author.

New York, 1 October, 1957
