国际知名大学原版教材

——信息技术学科与电气工程学科系列

出 版 说 明

郑大钟
清华大学信息科学与技术学院

当前，在我国的高等学校中，教学内容和课程体系的改革已经成为教学改革中的一个非常突出的问题，而为数不少的课程教材中普遍存在的“课程体系老化，内容落伍时代，本研层次不清”的现象又是其中的急需改变的一个重要方面。同时，随着科教兴国方针的贯彻落实，要求我们进一步转变观念扩大视野，使教学过程适应以信息技术为先导的技术革命和我国社会主义市场经济体制的需要，加快教学过程的国际化进程。在这方面，系统地研究和借鉴国外知名大学的相关教材，将会对推进我们的课程改革和推进我国大学教学的国际化进程，乃至对我们一些重点大学建设国际一流大学的努力，都将具有重要的借鉴推动作用。正是基于这种背景，我们决定在国内推出信息技术学科和电气工程学科国外知名大学原版系列教材。

本系列教材的组编将遵循如下的几点基本原则。(1)书目的范围限于信息技术学科和电气工程学科所属专业的技术基础课和主要的专业课。(2)教材的范围选自于具有较大影响且为国外知名大学所采用的教材。(3)教材属于在近5年内所出版的新书或新版书。(4)教材适合于作为我国大学相应课程的教材或主要教学参考书。(5)每本列选的教材都须经过国内相应领域的资深专家审看和推荐。(6)教材的形式直接以英文原版形式印刷出版。

本系列教材将按分期分批的方式组织出版。为了便于使用本系列教材的相关教师和学生从学科和教学的角度对其在体系和内容上的特点和特色有所了解，在每本教材中都附有我们所约请的相关领域资深教授撰写的影印版序言。此外，出于多样化的考虑，对于某些基本类型的课程，我们还同时列选了多于一本的不同体系、不同风格和不同层次的教材，以供不同要求和不同学时的同类课程的选用。

本系列教材的读者对象为信息技术学科和电气工程学科所属各专业的本科生，同时兼顾其他工程学科专业的本科生或研究生。本系列教材，既可采用作为相应课程的教材或教学参考书，也可提供作为工作于各个技术领域的工程师和技术人员的自学读物。

组编这套国外知名大学原版系列教材是一个尝试。不管是书目确定的合理性，教材选择的恰当性，还是评论看法的确切性，都有待于通过使用和实践来检验。感谢使用本系列教材的广大教师和学生的支持。期望广大读者提出意见和建议。

Power Generation Operation and Con trol, 2nd edition

影 印 版 序

Allen J. Wood 和 Bruce F. Wollenberg 合著的“Power Generation, Operation and Control”一书是 Wood 教授在 Rensselaer Polytechnic Institute（RPI）和 Wollenberg 教授在 Minnesota 大学多年来为大学本科高年级的学生和研究生讲授同名课程所用的教科书。它的第一版出版于 1984 年，11 年后，作者根据技术的发展，进行了修订，即 1996 年出版的本书（第二版）。

本书为电力系统专业的大学生和研究生提供了一本很有特色的教材，内容涵盖了发电厂、电力系统经济优化运行和控制的基本内容，包括：各种发电机组的运行特性、火电机组的经济调度和各种优化方法、输电网络的影响、机组组合、水火协调、生产费用模型、发电控制、互联系统的电力和电能交换、电力系统的安全约束等。对电力系统的状态估计和优化潮流也作了介绍。

本书一个突出的特点在于它的取材，既保持基础理论的稳定性，又充分反映了时代和技术的发展。自 20 世纪 80 年代中期以来，由于技术方面（包括计算机技术，相应的优化理论、方法及其实现以及它们在电力系统中的应用）有了长足的进步发展，电力行业的运营体制方面，许多国家进行了以“放松管制（Deregulation），引入竞争”为主要内容的各种模式的市场化改革尝试，电力系统的运行发生了很大的变化，提出了许多新问题，呼唤着新的理论、新的方法。这些新的变化和问题在本书（第二版）中得到了反映，随着时代的发展，内容的更新使本书保持着生命的活力。

同时，本书作为一本教科书，还具有下列一些鲜明的特点：

1．内容精练，着重于基本的概念、理论和方法，文字通顺易读；

2．作为工程专业的学生读物，着重于应用和工程实践；

3．各章有大量的计算实例、问题讨论和习题，有利于读者对内容的理解和掌握；

4．各章的最后，列出进一步的参考书目（Further Reading），为需要深入学习和研究的读者带来了很大的方便。

本书的影印出版，不仅为我国电力系统专业的大学生、研究生提供了一本很好的原版教材，同时也为广大教师和科研人员提供了很有价值的参考书。

陈寿孙 教授
清华大学电机工程与应用电子技术系
2003 年 1 月于清华园

PREFACE TO THE SECOND EDITION

It has been 11 years since the first edition was published. Many developments have taken place in the area covered by this text and new techniques have been developed that have been applied to solve old problems. Computing power has increased dramatically, permitting the solution of problems that were previously left as being too expensive to tackle. Perhaps the most important development is the changes that are taking place in the electric power industry with new, nonutility participants playing a larger role in the operating decisions.

It is still the intent of the authors to provide an introduction to this field for senior or first-year graduate engineering students. The authors have used the text material in a one-semester (or two-quarter) program for many years. The same difficulties and required compromises keep occurring. Engineering students are very comfortable with computers but still do not usually have an appreciation of the interaction of human and economic factors in the decisions to be made to develop "optimal" schedules; whatever that may mean. In 1995, most of these students are concurrently being exposed to courses in advanced calculus and courses that explore methods for solving power flow equations. This requires some coordination. We have also found that very few of our students have been exposed to the techniques and concepts of operations research, necessitating a continuing effort to make them comfortable with the application of optimization methods. The subject area of this book is an excellent example of optimization applied in an important industrial system.

The topic areas and depth of coverage in this second edition are about the same as in the first, with one major change. Loss formulae are given less space and supplemented by a more complete treatment of the power-flow-based techniques in a new chapter that treats the optimal power flow (OPF). This chapter has been put at the end of the text. Various instructors may find it useful to introduce parts of this material earlier in the sequence; it is a matter of taste, plus the requirement to coordinate with other course coverage. (It is difficult to discuss the OPF when the students do not know the standard treatment for solving the power flow equations.)

The treatment of unit commitment has been expanded to include the Lagrange relaxation technique. The chapter on production costing has been revised to change the emphasis and introduce new methods. The market structures for bulk power transactions have undergone important changes

throughout the world. The chapter on interchange transactions is a "progress report" intended to give the students an appreciation of the complications that may accompany a competitive market for the generation of electric energy. The sections on security analysis have been updated to incorporate an introduction to the use of bounding techniques and other contingency selection methods. Chapter 13 on the OPF includes a brief coverage of the security-constrained OPF and its use in security control.

The authors appreciate the suggestions and help offered by professors who have used the first edition, and our students. (Many of these suggestions have been incorporated; some have not, because of a lack of time, space or knowledge.) Many of our students at Rensselaer Polytechnic Institute (RPI) and the University of Minnesota have contributed to the correction of the first edition and undertaken hours of calculations for home-work solutions, checked old examples, and developed data for new examples for the second edition. The 1994 class at RPI deserves special and honorable mention. They were subjected to an early draft of the revision of Chapter 8 and required to proofread it as part of a tedious assignment. They did an outstanding job and found errors of 10 to 15 years standing. (A note of caution to any of you professors that think of trying this; it requires more work than you might believe. How would you like 20 critical editors for your lastest, glorious tome?)

Our thanks to Kuo Chang, of Power Technologies, Inc., who ran the computations for the bus marginal wheeling cost examples in Chapter 10. We would also like to thank Brian Stott, of Power Computer Applications, Corp., for running the OPF examples in Chapter 13.

ALLEN J. WOOD
BRUCE F. WOLLENBERG

PREFACE TO THE FIRST EDITION

The fundamental purpose of this text is to introduce and explore a number of engineering and economic matters involved in planning, operating, and controlling power generation and transmission systems in electric utilities. It is intended for first-year graduate students in electric power engineering. We believe that it will also serve as a suitable self-study text for anyone with an undergraduate electrical engineering education and an understanding of steady-state power circuit analysis.

This text brings together material that has evolved since 1966 in teaching a graduate-level course in the electric power engineering department at Rensselaer Polytechnic Institute (RPI). The topics included serve as an effective means to introduce graduate students to advanced mathematical and operations research methods applied to practical electric power engineering problems. Some areas of the text cover methods that are currently being applied in the control and operation of electric power generation systems. The overall selection of topics, undoubtedly, reflects the interests of the authors.

In a one-semester course it is, of course, impossible to consider all the problems and "current practices" in this field. We can only introduce the types of problems that arise, illustrate theoretical and practical computational approaches, and point the student in the direction of seeking more information and developing advanced skills as they are required.

The material has regularly been taught in the second semester of a first-year graduate course. Some acquaintance with both advanced calculus methods (e.g., Lagrange multipliers) and basic undergraduate control theory is needed. Optimization methods are introduced as they are needed to solve practical problems and used without recourse to extensive mathematical proofs. This material is intended for an engineering course: mathematical rigor is important but is more properly the province of an applied or theoretical mathematics course. With the exception of Chapter 12, the text is self-contained in the sense that the various applied mathematical techniques are presented and developed as they are utilized. Chapter 12, dealing with state estimation, may require more understanding of statistical and probabilistic methods than is provided in the text.

The first seven chapters of the text follow a natural sequence, with each succeeding chapter introducing further complications to the generation

scheduling problem and new solution techniques. Chapter 8 treats methods used in generation system planning and introduces probabilistic techniques in the computation of fuel consumption and energy production costs. Chapter 8 stands alone and might be used in any position after the first seven chapters. Chapter 9 introduces generation control and discusses practices in modern U.S. utilities and pools. We have attempted to provide the "big picture" in this chapter to illustrate how the various pieces fit together in an electric power control system.

The topics of energy and power interchange between utilities and the economic and scheduling problems that may arise in coordinating the economic operation of interconnected utilities are discussed in Chapter 10. Chapters 11 and 12 are a unit. Chapter 11 is concerned with power system security and develops the analytical framework used to control bulk power systems in such a fashion that security is enhanced. Everything, including power systems, seems to have a propensity to fail. Power system security practices try to control and operate power systems in a defensive posture so that the effects of these inevitable failures are minimized. Finally, Chapter 12 is an introduction to the use of state estimation in electric power systems. We have chosen to use a maximum likelihood formulation since the quantitative measurement–weighting functions arise in a natural sense in the course of the development.

Each chapter is provided with a set of problems and an annotated reference list for further reading. Many (if not most) of these problems should be solved using a digital computer. At RPI we are able to provide the students with some fundamental programs (e.g., a load flow, a routine for scheduling of thermal units). The engineering students of today are well prepared to utilize the computer effectively when access to one is provided. Real bulk power systems have problems that usually call forth Dr. Bellman's curse of dimensionality—computers help and are essential to solve practical-sized problems.

The authors wish to express their appreciation to K. A. Clements, H. H. Happ, H. M. Merrill, C. K. Pang, M. A. Sager, and J. C. Westcott, who each reviewed portions of this text in draft form and offered suggestions. In addition, Dr. Clements used earlier versions of this text in graduate courses taught at Worcester Polytechnic Institute and in a course for utility engineers taught in Boston, Massachusetts.

Much of the material in this text originated from work done by our past and current associates at Power Technologies, Inc., the General Electric Company, and Leeds and Northrup Company. A number of IEEE papers have been used as primary sources and are cited where appropriate. It is not possible to avoid omitting, references and sources that are considered to be significant by one group or another. We make no apology for omissions and only ask for indulgence from those readers whose favorites have been left out. Those interested may easily trace the references back to original sources.

We would like to express our appreciation for the fine typing job done on the original manuscript by Liane Brown and Bonnalyne MacLean.

This book is dedicated in general to all of our teachers, both professors and associates, and in particular to Dr. E. T. B. Gross.

CONTENTS

Preface to the Second Edition xi

Preface to the First Edition xiii

1 Introduction 1

1.1 Purpose of the Course 1
1.2 Course Scope 1
1.3 Economic Importance 2
1.4 Problems: New and Old 3
Further Reading 6

2 Characteristics of Power Generation Units 8

2.1 Characteristics of Steam Units 8
2.2 Variations in Steam Unit Characteristics 12
2.3 Cogeneration Plants 17
2.4 Light-Water Moderated Nuclear Reactor Units 19
2.5 Hydroelectric Units 20
Appendix: Typical Generation Data 23
References 28

3 Economic Dispatch of Thermal Units and Methods of Solution 29

3.1 The Economic Dispatch Problem 29
3.2 Thermal System Dispatching with Network Losses Considered 35
3.3 The Lambda-Iteration Method 39
3.4 Gradient Methods of Economic Dispatch 43
3.4.1 Gradient Search 43
3.4.2 Economic Dispatch by Gradient Search 44
3.5 Newton's Method 47
3.6 Economic Dispatch with Piecewise Linear Cost Functions 49
3.7 Economic Dispatch Using Dynamic Programming 51
3.8 Base Point and Participation Factors 55
3.9 Economic Dispatch Versus Unit Commitment 57
Appendix 3A: Optimization within Constraints 58
Appendix 3B: Dynamic-Programming Applications 72

Problems 79
Further Reading 88

4 Transmission System Effects 91

4.1 The Power Flow Problem and Its Solution 93
4.1.1 The Power Flow Problem on a Direct Current Network 94
4.1.2 The Formulation of the AC Power Flow 97
4.1.2.1 The Gauss–Seidel Method 99
4.1.2.2 The Newton–Raphson Method 99
4.1.3 The Decoupled Power Flow 105
4.1.4 The "DC" Power Flow 108
4.2 Transmission Losses 111
4.2.1 A Two-Generator System 111
4.2.2 Coordination Equations, Incremental Losses, and Penalty Factors 114
4.2.3 The *B* Matrix Loss Formula 116
4.2.4 Exact Methods of Calculating Penalty Factors 120
4.2.4.1 A Discussion of Reference Bus Versus Load Center Penalty Factors 120
4.2.4.2 Reference-Bus Penalty Factors Direct from the AC Power Flow 122
Appendix: Power Flow Input Data for Six-Bus System 123
Problems 124
Further Reading 129

5 Unit Commitment 131

5.1 Introduction 131
5.1.1 Constraints in Unit Commitment 134
5.1.2 Spinning Reserve 134
5.1.3 Thermal Unit Constraints 136
5.1.4 Other Constraints 137
5.1.4.1 Hydro-Constraints 137
5.1.4.2 Must Run 138
5.1.4.3 Fuel Constraints 138
5.2 Unit Commitment Solution Methods 138
5.2.1 Priority-List Methods 139
5.2.2 Dynamic-Programming Solution 141
5.2.2.1 Introduction 141
5.2.2.2 Forward DP Approach 142
5.2.3 Lagrange Relaxation Solution 152
5.2.3.1 Adjusting λ 155

Appendix: Dual Optimization on a Nonconvex Problem 160
Problems 166
Further Reading 169

6 Generation with Limited Energy Supply 171

6.1 Introduction 171
6.2 Take-or-Pay Fuel Supply Contract 172
6.3 Composite Generation Production Cost Function 176
6.4 Solution by Gradient Search Techniques 181
6.5 Hard Limits and Slack Variables 185
6.6 Fuel Scheduling by Linear Programming 187
Appendix: Linear Programming 195
Problems 204
Further Reading 207

7 Hydrothermal Coordination 209

7.1 Introduction 209
7.1.1 Long-Range Hydro-Scheduling 210
7.1.2 Short-Range Hydro-Scheduling 211
7.2 Hydroelectric Plant Models 211
7.3 Scheduling Problems 214
7.3.1 Types of Scheduling Problems 214
7.3.2 Scheduling Energy 214
7.4 The Short-Term Hydrothermal Scheduling Problem 218
7.5 Short-Term Hyrdo-Scheduling: A Gradient Approach 223
7.6 Hydro-Units in Series (Hydraulically Coupled) 228
7.7 Pumped-Storage Hydroplants 230
7.7.1 Pumped-Storage Hydro-Scheduling with a λ–γ Iteration 231
7.7.2 Pumped-Storage Scheduling by a Gradient Method 234
7.8 Dynamic-Programming Solution to the Hydrothermal Scheduling Problem 240
7.8.1 Extension to Other Cases 246
7.8.2 Dynamic-Programming Solution to Multiple Hydroplant Problem 248
7.9 Hydro-Scheduling Using Linear Programming 250
Appendix: Hydro-Scheduling with Storage Limitations 253
Problems 256
Further Reading 262

8 Production Cost Models 264

8.1 Introduction 264
8.2 Uses and Types of Production Cost Programs 267

8.2.1 Production Costing Using Load-Duration Curves 270
8.2.2 Outages Considered 277
8.3 Probabilistic Production Cost Programs 282
8.3.1 Probabilistic Production Cost Computations 283
8.3.2 Simulating Economic Scheduling with the Unserved Load Method 284
8.3.3 The Expected Cost Method 296
8.3.4 A Discussion of Some Practical Problems 302
8.4 Sample Computation and Exercise 310
8.4.1 No Forced Outages 310
8.4.2 Forced Outages Included 313
Appendix: Probability Methods and Uses in Generation Planning 316
Problems 323
Further Reading 324

9 Control of Generation 328

9.1 Introduction 328
9.2 Generator Model 328
9.3 Load Model 332
9.4 Prime-Mover Model 335
9.5 Governor Model 336
9.6 Tie-Line Model 341
9.7 Generation Control 345
9.7.1 Supplementary Control Action 346
9.7.2 Tie-Line Control 346
9.7.3 Generation Allocation 350
9.7.4 Automatic Generation Control (AGC) Implementation 352
9.7.5 AGC Features 355
Problems 356
Further Reading 360

10 Interchange of Power and Energy 363

10.1 Introduction 363
10.2 Economy Interchange between Interconnected Utilities 367
10.3 Interutility Economy Energy Evaluation 372
10.4 Interchange Evaluation with Unit Commitment 374
10.5 Multiple-Utility Interchange Transactions 375
10.6 Other Types of Interchange 378
10.6.1 Capacity Interchange 378
10.6.2 Diversity Interchange 379
10.6.3 Energy Banking 379
10.6.4 Emergency Power Interchange 379
10.6.5 Inadvertent Power Exchange 380

10.7 Power Pools 380
10.7.1 The Energy-Broker System 382
10.7.2 Allocating Pool Savings 385
10.8 *Transmission Effects and Issues* 390
10.8.1 Transfer Limitations 391
10.8.2 Wheeling 393
10.8.3 Rates for Transmission Services in Multiparty Utility Transactions 395
10.8.4 Some Observations 401
10.9 Transactions Involving Nonutility Parties 401
Problems 405
Further Reading 409

11 Power System Security 410

11.1 Introduction 410
11.2 Factors Affecting Power System Security 414
11.3 Contingency Analysis: Detection of Network Problems 415
11.3.1 An Overview of Security Analysis 421
11.3.2 Linear Sensitivity Factors 421
11.3.3 AC Power Flow Methods 427
11.3.4 Contingency Selection 430
11.3.5 Concentric Relaxation 432
11.3.6 Bounding 433
Appendix 11A: Calculation of Network Sensitivity Factors 439
Appendix 11B: Derivation of Equation 11.14 444
Problems 445
Further Reading 450

12 An Introduction to State Estimation in Power Systems 453

12.1 Introduction 453
12.2 Power System State Estimation 453
12.3 Maximum Likelihood Weighted Least-Squares Estimation 458
12.3.1 Introduction 458
12.3.2 Maximum Likelihood Concepts 460
12.3.3 Matrix Formulation 465
12.3.4 An Example of Weighted Least-Squares State Estimation 467
12.4 State Estimation of an AC Network 472
12.4.1 Development of Method 472
12.4.2 Typical Results of State Estimation on an AC Network 475

12.5 State Estimation by Orthogonal Decomposition 479
12.5.1 The Orthogonal Decomposition Algorithm 482
12.6 An Introduction to Advanced Topics in State Estimation 487
12.6.1 Detection and Identification of Bad Measurements 487
12.6.2 Estimation of Quantities Not Being Measured 493
12.6.3 Network Observability and Pseudo-measurements 493
12.7 Application of Power Systems State Estimation 499
Appendix: Derivation of Least-Squares Equations 501
Problems 508
Further Reading 512

13 Optimal Power Flow **514**

13.1 Introduction 514
13.2 Solution of the Optimal Power Flow 516
13.2.1 The Gradient Method 518
13.2.2 Newton's Method 529
13.3 Linear Sensitivity Analysis 531
13.3.1 Sensitivity Coefficients of an AC Network Model 532
13.4 Linear Programming Methods 534
13.4.1 Linear Programming Method with Only Real Power Variables 538
13.4.2 Linear Programming with AC Power Flow Variables and Detailed Cost Functions 546
13.5 Security-Constrained Optimal Power Flow 547
13.6 Interior Point Algorithm 551
13.7 Bus Incremental Costs 553
Problems 555
Further Reading 558

Appendix: About the Software **561**

Index **565**

1 Introduction

1.1 PURPOSE OF THE COURSE

The objectives of a first-year, one-semester graduate course in electric power generation, operation, and control include the desire to:

1. Acquaint electric power engineering students with power generation systems, their operation in an economic mode, and their control.
2. Introduce students to the important "terminal" characteristics for thermal and hydroelectric power generation systems.
3. Introduce mathematical optimization methods and apply them to practical operating problems.
4. Introduce methods for solving complicated problems involving both economic analysis and network analysis and illustrate these techniques with relatively simple problems.
5. Introduce methods that are used in modern control systems for power generation systems.
6. Introduce "current topics": power system operation areas that are undergoing significant, evolutionary changes. This includes the discussion of new techniques for attacking old problems and new problem areas that are arising from changes in the system development patterns, regulatory structures, and economics.

1.2 COURSE SCOPE

Topics to be addressed include:

1. Power generation characteristics.
2. Economic dispatch and the general economic dispatch problem.
3. Thermal unit economic dispatch and methods of solution.
4. Optimization with constraints.
5. Using dynamic programming for solving economic dispatch and other optimization problems.
