## 第二章 头针疗法

### CHAPTER TWO SCALP ACUPUNCTURE

#### 2.1 头针选穴原则

##### 2.1 Principles of Site Selection

单侧肢体疾病,选用对侧刺激区;双侧肢体疾病,选用双侧刺激区;内脏、全身疾病或不易区别左右的疾病,可双侧取穴。一般根据疾病选用相应的刺激区,并可选用有关刺激区配合治疗,如下肢瘫痪可选用下肢运动区配足运感区。

For diseases affecting only one limb, a site is selected on the contralateral side of the head. Diseases affecting the limbs bilaterally are treated by stimulating sites on both sides of the head. Diseases of the internal organs or those which are systemic in nature, or those illnesses which are difficult to distinguish as being on one side or the other are treated by stimulating sites on both sides of the head. For instance, when treating paralysis of the lower limb, the principal site is the lower limb and trunk area in the motor area, supplemented by leg motor and sensory area.

## 2.2 操作方法

### 2.2 Method

明确诊断，选定刺激区，取得病员合作。病员取坐位或卧位，分开头发，常规消毒，选用 26~30 号 1.5~2.5 寸长的不锈钢毫针。

Diagnosing the diseases, selecting the area to be stimulated and asking the cooperation of patients. Expose the scalp and clean with alcohol. Usually 26—30, 1.5 to 2.5 cun in length stainless steel filiform needles are used.

#### 2.2.1 快速进针

##### 2.2.1 Swift Insertion

针尖与头皮呈 30° 左右夹角，快速刺入皮下，然后沿刺激区快速推进（不捻转）到相应的深（长）度（或用捻转法进针）。

The needle is inserted in an angle of 30° to the scalp swiftly, Then inserted further along the area stimulated to be (not rotating) to requisite portion. (or inserting the needle with Twirling method)

#### 2.2.2 快速捻转

##### 2.2.2 Rapid Twirling

进针以后，使针体来回快速旋转（200 次/分）左右，捻转持续约 0.5~1 分钟，然后静留针 5~10 分钟重复捻转，用同样的方法再捻转两次，即可起针。也可用电针代替手捻进行治疗，据报道电针刺激头皮相应刺激区，治疗脑血管意外后遗症偏瘫的疗效与手法捻转的疗效相同。
